

Clinical Trial Protocol

Iranian Registry of Clinical Trials

17 Jun 2026

Evaluating the relative expression and effects of methyltransferase on global genomic methylation rate in sperms of Oligoasthenoteratozoospermia patients with protamine deficiency before and after of folic acid uptake

Protocol summary

Summary

The goal is to evaluate semen parameters and sperm chromatin DNA methylation after taking folic in men with severe sperm abnormalities. Among men referred to Yazd Research Institute for Infertility, 50 men who are seeking treatment for infertility, sperm analysis has fewer parameters according to World health Organisation criteria and protamine deficiency (CMA3) test are selected and divided into two groups and after medication will be reviewed. The 30 men who have normal parameters and are normal CMA3 will be in a control group. In the intervention group after andrology assessments will be randomly divided into two groups of 25 patients, treated with vitamin E and selenium with or without folic acid for two months . After washing the samples in different groups, the viability of sperm with eosin,cellular tests to evaluate sperm chromatin integrity will be done. These tests include aniline blue, toluidine blue. To evaluate genetically, sperm samples will be prepared by with buffer and divided into two parts and stored frozen at -80 ° C. After preparation of the samples, RNA extraction protocol is performed. Then specimens are examined by PCR Real time. After two months, the patients will be genetically re-examination and then the results will be discussed between the groups.

Trial completion date

empty

Scientific title

Evaluating the relative expression and effects of methyltransferase on global genomic methylation rate in sperms of Oligoasthenoteratozoospermia patients with protamine deficiency before and after of folic acid uptake

Public title

ffects of the relative expression of genes of sperm DNA methyltransferase on global methylation in patients with severe sperm abnormalities before and after folic acid uptake

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria includes severe sperm parameters and protamine disrupted, age less than 40, avoiding the use of drugs or alcohol, and varicocele Exclusion criteria: Unwillingness to continue during study,Diabetes,Blood Hypertension, obesity

Age

From **20 years** old to **40 years** old

Gender

Male

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: **90**

Health conditions studied

1

Description of health condition studied

Oligospermia

ICD-10 code

-

ICD-10 code description

-

Primary outcomes

1

Description

Sperm parameters including count, motility, morphology

Timepoint

Two months after the intervention

Method of measurement

Microscopic examination of sperm

2

Description

Relative gene expression of methyltransferase

Timepoint

Two months after the intervention

Method of measurement

PCR Real time

3

Description

Phosphate group condensation

Timepoint

Two months after the intervention

Method of measurement

Toluidine Blue

4

Description

Protamin deficiency

Timepoint

Two months after the intervention

Method of measurement

CMA3

Secondary outcomes

1

Description

Flatulence, insomnia

Timepoint

Two month after intervention

Method of measurement

Questionnaire

Intervention groups

1

Description

folic acid tablet in intervention group

Category

Treatment - Drugs

2

Description

no intervention in control group

Category

Treatment - Drugs
