Comparison of effect of Conventional and Optical coherence tomography Angiography-guided laser Photocoagulation to treatment of focal diabetic macular edema

Protocol summary

Study aim

Comparison of effect of Conventional and Optical coherence tomography Angiography-guided laser Photocoagulation to treatment of focal diabetic macular edema

Design

Patients referred to the clinic during one year who have focal macular edema due to diabetes and are indicated for treatment, are easily divided into two groups by simple sampling method without blindness and one in between. The number of samples is 40 people who are in two groups of 20. Randomizer software was used for randomization.

Settings and conduct

Tabriz Nikoukari Eye Hospital

Participants/Inclusion and exclusion criteria

Inclusion criteria: Diabetic patients referred to charity hospital with focal macular edema who are treated according to clinically significant macular edema criteria. Exclusion criteria: History of any retinal laser therapy; history of intraocular injection of anti-VEGF in the previous three months; evidence of severe macular ischemia on angiography ...etl

Intervention groups

After the initial examination and initial BCVA recording and initial OCT, patients are randomly divided into two groups. In the first group, without OCT-A, patients are treated with macular laser. Laser specifications include yellow wavelength duration: 0.1 and power between 80 to 150 and spot size is 50 micrometers, which is done at intervals of one spot in edematous areas. The goal is to change the light color to light gray in the laser-treated areas. In this group, we use the yellow wavelength with a duration: 0.1 and spot size: 50 micrometers with an intensity between 80 to 150 in the areas of microaneurysms. The goal is to change the light gray color in the place of microaneurysms.

Main outcome variables

Visual acuity; Macular thickness

Scientific title
Comparison of effect of Conventional and Optical coherence tomography Angiography-guided laser Photocoagulation to treatment of focal diabetic macular edema

Public title
Laser treatment of macular edema with the help of angiography

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
 Diabetic patients Focal macular edema Indication of treatment according to clinically significant macular edema criteria
Exclusion criteria:
 History of any retinal laser History of intraocular injection of anti-VEGF in the last three months Evidence of severe macular ischemia on angiography History of regional steroid injection in the last 4 months The presence of subfoveal edema Impossibility of laser due to insufficient vision History of any eye disease other than retinopathy, including uveitis glaucoma, degenerative diseases, and dystrophies Pregnant and lactating women Existence of diabetic nephropathy

Age

Health conditions studied

1

Description of health condition studied

Macular edema caused by diabetes

ICD-10 code

E08.311

ICD-10 code description

Diabetes mellitus due to underlying condition with unspecified diabetic retinopathy with macular edema

Primary outcomes

1

Description

Patient vision

Timepoint

two months

Method of measurement

For this purpose, we analyze the data obtained from visual acuity based on LOGMAR between the two groups.

Secondary outcomes

1

Description

macular thickness

Timepoint

two months

Method of measurement

data collected from macular thickness based on microns using INDEPENDENT SAMPLE T TEST method between the two groups.

Intervention groups

1

Description

First group: patients undergo macular laser treatment without OCT-A. Laser specifications include yellow wavelength duration: 0.1 and power between 80 to 150 and spot size 50 micrometers, which is done at intervals

of one spot in edematous areas. The goal is to change the color light to light gray in the laser areas

Category

Treatment - Surgery

2

Description

Second group: After performing the OCT-A and locating the microaneurysms, laser therapy is performed. In this group, we use the yellow wavelength with duration: 0.1 and spot size: 50 micrometers with an intensity between 80 and 150 in the areas of microaneurysms. Light gray is present at the site of microaneurysms. Patients are followed up three times after the laser, at two-month intervals, including BCVA measurements and OCT. After collecting the data, they are analyzed and statistically analyzed
