The Effect Of Education Based On Health Belief Model On Behavior And Nutritional Indicators Of Patients With Myocardial Infarction

Protocol summary

Study aim

Determining the effect of education based on health belief model on behavior and nutritional indicators in patients with myocardial infarction

Design

A clinical trial study with intervention and control groups on 72 patients was randomized. A table of random numbers is used for randomization.

Settings and conduct

This study is a prospective clinical trial that will be performed on 72 patients with myocardial infarction referred to the Rehabilitation Clinic of the Rehabilitation Research Center, Cardiovascular Research Institute. patient will be divided into two groups of intervention and control using a table of random numbers, and patients in the intervention group will receive educational content related to proper nutrition based on the health belief model during 4 sessions. Data will be collected and analyzed using questionnaires measuring the structures of the Health Belief Model, three-day food registration and demographic characteristics before, one and three months after the intervention.

Participants/Inclusion and exclusion criteria

Inclusion criteria included all patients with myocardial infarction and exclusion criteria included low literacy and unwillingness to participate in the study.

Intervention groups

The intervention will be done by holding training classes for the intervention group in 4 sessions over 4 weeks using educational methods (lectures, questions and answers and using PowerPoint). The control group will also receive only the usual training of the rehabilitation center.

Main outcome variables

total cholesterol, HDL, LDL, blood sugar and body mass index.

Scientific title

The Effect Of Education Based On Health Belief Model On Behavior And Nutritional Indicators Of Patients With Myocardial Infarction

Public title

The Effect Of Education On Behavior And Nutritional Indicators Of Patients With Myocardial Infarction

Purpose

Education/Guidance

Inclusion/Exclusion criteria

Inclusion criteria:

literacy ability to communicate having myocardial infarction complete health of sight and hearing lack of a special diet

Exclusion criteria:

Existence of severe disease conditions that prevent the patient from participating in education and learning participation in educational programs similar to the present study cancellation of cooperation non-participation in at least two training sessions the existence of underlying disease that interferes with the counseling program

Age

No age limit

Gender

Sample size

Target sample size: 72

Randomization (investigator's opinion)

Randomized

Randomization description

Persons will be divided into two groups of intervention and control based on a simple randomization method using a random number table. In this method, we put a set of numbers in the table without a specific pattern and order and completely randomly. To use a table of random numbers, we first specify the table numbers to read (for example, up, down, left, or right), then assume specific numbers for each group: We consider even numbers for the intervention group and odd numbers for the control group. Then we touch one of the numbers and move in one of the predetermined directions and record the numbers and assign them to the intervention and control groups.

Intervention groups

1

Description

Intervention group: Patients with myocardial infarction in the intervention group, nutrition training intervention based on the structures of the Health Belief Model by holding 4 sessions of 60 minutes (Within a month, one session per week) using the methods Lectures, questions and answers, and slide shows will be held, and patients will be followed up by telephone during this time. The educational content has been prepared by the research team and it has been tried to make all the contents simple and understandable for all patients. The nutritional educational content is adjusted based on the economic situation of the people and includes: correcting the type and amount of oil consumed, correct cooking method and not using frying Increase consumption of vegetables and fruits to at least 5 units per day, replace low-fat dairy products with high-fat ones, reduce salt consumption, remove salt shakers from the table and avoid salty foods, eat lean meats, separate chicken skin before cooking, replace Vegetable protein instead of animal, eat fish 1 to 2 times a week, eat oily nuts 5 times a week, do not eat sweets and fatty foods. To measure the effect of the intervention, one and three months after the end of the training program, the data will be collected again. Also, three months after the intervention, blood sugar, total cholesterol, HDL, LDL, BMI will be measured.

Category

Behavior

2

Description

Control group: The control group did not receive any educational intervention and used only the routine training of the rehabilitation center. It should be noted that at the end of the study, in order to observe ethics in

research, all trainings will be provided to the control group.
