Comparing the Effectiveness of Acceptance and Commitment-Based Therapy (ACT) and Compassion-Focused Therapy and acceptance and commitment therapy enriched with compassion on Social Cohesion, Mental Well-being, and Improving Communication Patterns of Married Women with Depression and Marital Conflicts

Protocol summary

Study aim

In this study, we compare the effectiveness of commitment-based therapy and compassion-focused therapy and therapy based on compassion-enriched acceptance and commitment on social adjustment, mental well-being, and improving communication patterns in married women with depression and marital conflict.

Design

A clinical trial with a control group will be performed on married women with depression and marital conflicts referred to counseling centers.

Settings and conduct

The sampling method is as follows: from among the counseling centers of Mashhad, three centers are randomly selected. They have 20 people and a total of 60 people are selected and randomly divided into 4 groups (three experiments and one control group). Group intervention in 8 90-minute training sessions It will be performed for the subjects of the experimental groups.

Participants/Inclusion and exclusion criteria

Existence of marital conflicts
Diagnosis of moderate depression based on structured interview based on DSM-V and Beck test 3. The duration of marriage is between 5-25 years
4- Age range 25-45
5. Minimum diploma education
6- Consent and personal consent to participate in the research
7. The subject should not be under medical treatment to reduce anxiety and depression.

Intervention groups

1: Acceptance and Commitment Treatment
2: Compassion-focused therapy
3: Treat Compassion Enriched Acceptance and Commitment

Main outcome variables

Participants were assessed at three time intervals before

, after and 30 days after the intervention with Social Adjustment Questionnaire, mental well-being and communication patterns.

Randomization (investigator's opinion)

Randomized

Randomization description

Based on the inclusion and exclusion criteria of the study and conducting a pre-test session, 60 women who are

selected in the initial screening test, which includes clinical interview and completion of Beck Depression Inventory and Marital Conflict MCQ-Marital Conflict Questionnaire, by purposive sampling method. Considering that the study groups have an equal sample size, we use the simple random allocation law, which is one of the limited randomization methods, and divide the individuals into 3 intervention groups and a control group. Participants will be assigned to the control group (without therapeutic intervention), acceptance and commitment therapy (ACT), compassion-focused therapy (CFT), and compassion-enriched acceptance and commitment therapy with the help of a random number table. In this way, a number is assigned to each individual and using the table of random numbers of each selected number, it is randomly assigned to one of the groups and this work continues until the end of the number of people in each group. Therefore, the researcher will not have the option to change the status of individuals or predict it. For concealment, the method of opaque sealed envelopes with random sequence is used. So randomization in three steps: 1- Creating a random sequence: This is a simple or limited randomization step based on a table of random numbers. 2- Hide random assignment which is done in the form of coded boxes with random sequence. 3- Execution of random assignment process: A: Identify the person who creates the random sequence B: The person who evaluates and registers the researchers in terms of entry and exit criteria C: The person who assigns the participants to the groups
