U-shape incision on on prostate capsule: New intrapritineal laparoscopic technique in simple prostatectomy.

Protocol summary

Study aim

U-shape incision on on prostate capsule: New intrapritineal laparoscopic technique in simple prostatectomy

Design

A clinical trial with two groups of patients: parallel, therapeutic, blanced block randomization, single blind (patient). 10 patients referred to Sinai Hospital.

Settings and conduct

10 patients at Sina Hospital. blanced block randomization, single blind(patient). Patients are divided into two groups: Group 1: intrapritineal laparoscopic technique and U-shape incision on prostate capsule. Group 2: Extraperitoneal laparoscopic technique and direct incision on the prostate capsule.

Participants/Inclusion and exclusion criteria

Inclusion criteria:Patients with indications for prostate surgery: including infection, bladder stones, refractory retention, non-response to medical treatment, and refractory hematuria, Consent to participate in the study. Exclusion criteria:Abnormal rectal examination,Active infection,Severe heart or lung disease.

Intervention groups

Intervention group 1:intrapritineal laparoscopic technique and U-shape incision on prostate capsule. Intervention group 2:Extraperitoneal laparoscopic technique and direct incision on the prostate capsule.

Main outcome variables

Duration of surgery, Average bleeding during surgery, Average length of hospital stay.

Sample size
Target sample size: **10**

Randomization (investigator's opinion)
Randomized

Randomization description
The present study is a single-blind randomized clinical trial. For randomization, the blanced block randomization method is used to generate four blocks. Intervention group A and control group B have been determined. According to the randomization method, we expect the two groups to differ by a maximum of 2 people in terms of the number of people assigned. After the methodologist prepares the randomization sequence using the sealdenvelop online site, the generated sequence will be made available to a technician outside the research team. Quadruple blocks (A or B) are placed in envelopes. After the arrival of the first patient with the inclusion criteria, the envelopes are randomly selected and the type of patient group is informed to the research team through a trained technician. The patient is placed in (intrapritineal laparoscopic technique and U-shape incision on prostate capsule) or (Extraperitoneal laparoscopic technique and direct incision on the prostate capsule) group based on the randomly selected envelope.

Blinding (investigator's opinion)
Single blinded

Blinding description
Patients who have given their consent to participate in the study will be treated with intrapritineal laparoscopic technique and U-shape incision on prostate capsule or Extraperitoneal laparoscopic technique and direct incision on the prostate capsule. The patient has no information about the surgical procedure and the design.

ICD-10 code description

Other and unspecified disorders of prostate

Primary outcomes

1

Description

Improving surgical technique

Timepoint

before and one month after surgery

Method of measurement

International prostatectomy score, maximum urinary flow rate and Prostate-Specific Antigen

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: intrapritineal laparoscopic technique and U-shape incision on prostate capsule. During surgery; the patient is placed in the supine and intubated via a NG Tube. A Foley catheter 22f is inserted and the patient 's legs is placed at a 30-degree angle. Then a two-centimeter incision is made below the umbilicus, after that the peritoneum is opened and a 10 mm port is placed. The abdomen is then slowly filled with CO2 gas and two ports (5mm) are inserted in the umbilicus and the lateral of rectum under direct vision. In the next step,

peritoneum is opened in the anterior part of the bladder and then the fourth port is placed in the suprapubic area for suctioning. The prostate capsule is opened transversely by a U-Shape incision at the distance of 0.5 cm from the bladder neck. At this time, the prostate adenoma is removed by suction and after inserting a 22f catheter, the capsule is sutured continuously. Patient is discharged with the catheter. One week later, the patient catheter is removed and 3 months later, IPSS and QMAX will measured again.
