Immediate effect of soft tissue mobilization tool (Graston), static hold-relax, and muscle energy techniques on hamstring muscle shortness in healthy athletes: Randomized clinical trial

Protocol summary

Study aim

The aim of the present study was to compare the three methods of muscle energy technique, hold-relax, and soft tissue release tool on increasing hamstring muscle length in healthy athletes.

Design

A clinical trial with three treatment groups, with parallel, randomized groups, on 60 patients.

Www.randomization.com was used for randomization.

Settings and conduct

Location: Physiotherapy Clinic of Ghaem Hospital

Blinding: Assessors, analysis, Allocation

Participants/Inclusion and exclusion criteria

Inclusion criteria: Healthy athletes aged 18-50 years, Passive Straight Leg Raising Test should be 70 degrees or less (the lumbar spine arch will be maintained by the roll to prevent posterior pelvic tilt during the test

Exclusion criteria: Skin infections, Symptoms of lumbar disc herniation and neurological symptoms. Skin allergies,

Intervention groups

Soft tissue release tool: The shorter areas of the muscle are Gerston Instrument 4 (GT4) and finally one minute of very short strokes in small points by Greston Instrument 3 (GT3). In hold-relax group, the patients perform the usual warm-up ten minutes before exercise. The hold-relax technique will be performed. The MET group, who will receive the muscle energy technique. In this group, the patient performs the usual pre-workout warm-up for ten minutes, followed by muscle energy technique. T

Main outcome variables

Active Knee Extension Test score, Toe Touch Test score, Passive Straight Leg Raising Test score Tests will be measured before and immediately after the intervention.

Randomization (investigator's opinion)

Randomized

Randomization description

The randomization method will be the block method. The envelope method is that the envelopes are prepared and printed by a member of the research team random numbers with the help of Randomization.com site and placed inside the envelope Will take. The lid of the envelope will be closed and its contents will not be visible from the outside. Then, the purpose of the study is first explained to the person who meets the conditions, and the person, if desired, signs the informed consent form and takes an envelope, and then opens it and enters the intervention or control groups based on the contents of the envelope. . Allocation Concealment: Sealed envelopes

Blinding (investigator's opinion)

Double blinded

Blinding description

Blinding in allocation will be done using numeric codes. The secretary of the physiotherapy department of Ghaem Hospital in Mashhad will take the sheet out of the envelope and give it to the researcher. Based on the code, the researcher will assign the participant to the desired group. Also, the evaluator will only provide the result of the tests to the researcher, ساه does not know about the grouping codes. The names of the groups in

spss software will be written by code. The statistical analyzer will be blinded about grouping codes.

Intervention groups

1

Description

Intervention group: increasing hamstring muscle length using Hold Relax The patient performs the usual warm-up ten minutes before exercise. The hold-relax technique will be performed. The patient is in the supine position and the hip joint is in a 90 degree flexion position. The therapist will hold the patient's knee for 7 seconds until the person reports a slight feeling of tightness in their hamstring muscle. The patient is then asked to hold his or her knee (by pushing the foot toward the bed against the therapist's resistance) 80-90% maximal voluntary contraction for 7 seconds. It is important to note that no movement should be performed on the patient's knee and that a completely isometric contraction should be performed by the hamstring muscle. After the contraction, the patient relaxes the muscle for 5 seconds and is taken to a new range. The process will be repeated three times. The patient should not report any pain during the entire technique. This technique will be done in one session only.

Description

Intervention group: increasing hamstring muscle length using muscle energy technique. In this group, the patient performs the usual pre-workout warm-ups for ten minutes, followed by MET. The patient will be supine on the bed and the hip joint will be in a 90 degree flexion position. The therapist holds the patient's knee until the person reports a slight stretch in their hamstring muscle. The patient is then asked to maintain his or her knee at 15-20% of maximum voluntary contraction (by pushing the foot toward the bed against the therapist's resistance) for 7 seconds. It is important to note that no movement should be performed on the patient's knee and a completely isometric contraction will be performed by the hamstring muscle. After the contraction, the patient relaxes the muscle for 5 seconds and is taken to a new range. The process is repeated. The patient should

not report any pain during the entire technique. The therapist repeats this process 3 times. This technique will be done in one session only.

Title and more details about the data/document

All data is potentially shareable after un-identification of individuals

When the data will become available and for how long

Jan 2022

To whom data/document is available

It will be available only to researchers working in academic and scientific institutions.

Under which criteria data/document could be used

The data will be delivered to the applicants only for meta-analysis.

From where data/document is obtainable

Salman Nazary-Moghadam Nazaryms@mums.ac.ir

What processes are involved for a request to access data/document

After mailing, the request will be considered after two weeks, and the data will be delivered to the applicant.
