Prophylactic treatment with oral diazepam to prevent recurrence of febrile seizures following triple vaccination with DTP and MMR: Randomize Controlled Trial

Protocol summary

Study aim

Prophylactic treatment with oral diazepam to prevent recurrence of febrile seizures following DTP and MMR vaccination: Randomized controlled trial

Design

This study is a double-blind clinical trial with parallel groups using randomized block method, and sampling is done by available method among patients with a history of febrile seizures following vaccine injection, in both intervention and control groups, and the sample size in each group was 30 patients.

Settings and conduct

This study will be performed on 60 patients with a history of febrile seizures following vaccination referred to Abuzar and Golestan hospitals in Ahvaz. The patients will be randomly divided into two groups based on a random table of computer generated numbers, and one group will receive oral diazepam and the other group will receive only diazepam anal rescue tube therapy and will not receive prophylactic treatment.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Children 6 months to 6 years old who have had a seizure following vaccination and have no contraindications to vaccination. Patients with immunodeficiency, cancer, and patients taking corticosteroids are not included in the study. Exclusion criteria: Parental dissatisfaction, removal of the vaccine from the patient's vaccination schedule for any reason, history of oral diazepam allergy, Having contraindications for the MMR and DTP vaccines

Intervention groups

The intervention group in our study included individuals receiving oral diazepam. The control group received only salvage therapy with diazepam rectal tube.

Main outcome variables

The incidence of fever and also seizure at the time after the injection of the vaccines Occurrence of complications

such as drowsiness, dizziness, hypotension

Scientific title

Prophylactic treatment with oral diazepam to prevent recurrence of febrile seizures following triple vaccination with DTP and MMR: Randomize Controlled Trial

Public title

Treatment with Oral Diazepam for Prevention of Recurrence of Seizures following DTP and MMR Vaccination

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

Children 6 months to 6 years old who have had a seizure following the vaccine There are no contraindications to vaccination. Patients with immunodeficiency, cancer, and patients taking corticosteroids are not included in the study.

Exclusion criteria:

Parental dissatisfaction Remove the vaccine from the patient's immunization schedule for any reason History of oral diazepam allergy Having contraindications for the MMR and DTP vaccines

Age

From **6 months** old to **6 years** old

Gender

Sample size

Target sample size: **30**

Randomization (investigator's opinion)

Randomized

Randomization description

In this study, individuals are randomly divided into two groups based on four random block permutations. Also, in order to prevent confounding factors as well as reduce the bias caused by the opinions of the project guiding researchers, researchers involved in the levels of random sequencing, enrollment in terms of entry and exit criteria, assigning participants to the target groups will work separately.

Blinding (investigator's opinion)

Double blinded

Blinding description

In this clinical trial, patients will be randomly divided into two groups based on a randomly generated table of computer-generated numbers, with one group receiving oral diazepam and the other group (control) receiving only life-saving diazepam anal tube therapy. And will not receive preventive treatment.

Intervention groups

1

Description

Intervention group: The group that will be treated with oral diazepam, and in addition to rectal Diazepam tube, Diazepam tablets are received from Sobhan Company at a dose of 1 mg per kg for the first 48 hours of the vaccine injection.

Category

Prevention

2

Description

Control group: The group that will only receive life-saving treatment with diazepam rectal tube in case of seizures lasting more than 2 to 5 minutes and will not receive preventive treatment.
