

Clinical Trial Protocol

Iranian Registry of Clinical Trials

21 Jul 2026

Evaluation of the effectiveness of parent management training on dental plaque index in children with attention deficit hyperactivity disorder

Protocol summary

Study aim

Determination and comparison of plaque index in ADHD children receiving methylphenidate before and after the routine oral health training 2. Determination and comparison of plaque index in ADHD children receiving methylphenidate before and after PMT with emphasis on health education 3.comparison of plaque index changes in case and control groups

Design

randomized, parallel, single-blind clinical trial with 36 patients. The simple randomization method has been used for randomization.

Settings and conduct

First, in both groups, the dental plaque index will be measured using a detector solution. Then, the control group will get routine health training and a month later their dental plaque index will be registered by the same dentist. Case group parents will participate in 8, 1-hour PMT sessions at Razi Hospital in Tabriz with an interval of 1 week. Children's dental plaque will be re-evaluated one month after the end of the sessions.

Participants/Inclusion and exclusion criteria

Entry requirements 1.Children in the age range of 6 to 12 years 2. IQ above 70 in children 3. Higher education of parents 4. Cooperation and participation of parents in PMT classes 5. Responsible of patient care 6. Written informed consent Not entry conditions 1. Existence of major psychiatric pathology in parents 2. Existence of major psychiatric pathology other than ADHD in children. 3. Taking other psychiatric medications by the child 4. Lack of cooperation of the child

Intervention groups

The children will be divided into two groups of case and control. The case group parents will participate in 8 PMT sessions focusing on children's oral health and the control group will get routine health training such as the correct method of rolling brushing technique.

Main outcome variables

The main consequence is the children's plaque index,

which will be measured by the detector solution before and after the intervention.

- Data analyser

Sample sizeTarget sample size: **36****Randomization (investigator's opinion)**

Randomized

Randomization description

In this test, simple randomization will be used. in order to achieve two groups with equal sample size. 36 equal envelopes will be ready and 18 of them will be written group a and 18 of them will be written group b and the envelopes will be completely closed. Patients will be randomly assigned to one of these two groups by selecting an envelope. Group a will be the intervention group and group b will be the control.

Blinding (investigator's opinion)

Single blinded

Blinding description

The person examining the children's dental plaque index will not know in which study group the examined people are. Therefore, the study will be one-sided blind
