Effectiveness of Cognitive Orientation to daily Occupational Performance (CO-OP) on Satisfaction and Occupational Performance in Individuals with Parkinson's Disease

Protocol summary

Study aim

The Investigation of the Effectiveness of Cognitive Orientation to daily Occupational Performance (CO-OP) on Satisfaction and Occupational Performance in Individuals with Parkinson's Disease

Design

Clinical, Randomized, Double-blind trial with two parallel groups

Settings and conduct

For both groups, one-hour individual sessions will be held twice a week for 6 weeks at their home. Participants in the control group benefit from conventional occupational therapy. while in the intervention group, the CO-OP approach is implemented. The evaluations will be performed by a trained assessor who is blind to the study.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Participants with Parkinson's Disease diagnosed by a neurologist, Hoehn and Yahr scale score between stages 1-3, Minimum score of 16 out of 30 in the Montreal test, No other neurological or psychological problems, No verbal problem, Ability to understand the global strategy of the co-op approach. exclusion criteria: Comorbidity with cognitive impairments such as Alzheimer, stroke, brain injury, multiple sclerosis, etc. Lack of cooperation and willingness to continue cooperation.

Intervention groups

Participants in the intervention group will receive the Cognitive Orientation to daily Occupational Performance (CO-OP) approach and Participants in the control group will receive conventional occupational therapy. This study will be presented in 45 to 60 minutes twice a week for 12 sessions at home.

Main outcome variables

Performance, Satisfaction, Goal Attainment, Functional Independence and fatigue

Scientific title

Effectiveness of Cognitive Orientation to daily Occupational Performance (CO-OP) on Satisfaction and Occupational Performance in Individuals with Parkinson's Disease

Public title

Investigating effects of CO-OP approach in Individuals with Parkinson's Disease

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Diagnosis of Parkinson's Disease by a neurologist Hoehn and Yahr scale score between stages 1-3 A minimum score of 16 out of 30 on the Montreal Test No other neurological or psychological problems Not having a verbal problem And the ability to understand the global strategy of the CO-OP approach

Exclusion criteria:

Comorbidity with cognitive impairments such as: Alzheimer, stroke, brain injury, multiple sclerosis, etc. Lack of cooperation and willingness to continue cooperation

Age

No age limit

Gender

Both

Phase

N/A

Groups that have been masked

- Participant
- Outcome assessor

Sample size

Target sample size: 20

Randomization (investigator's opinion)

Randomized

Randomization description

Participants will select by convenience sampling. we use simple randomization for allocation of samples into the control and CO-OP group. For this purpose, before starting the intervention, through the site randomization.com, according to the sample size, a sequence of placing participants in two groups (both are equal) is created. After the start of the study, each participant who was eligible to enter the study will receive a control or co-op intervention from a pre-prepared sequence list.

Blinding (investigator's opinion)

Double blinded

Blinding description

Participants will not be aware of the group that they are entered. The assessments will be performed by participants and trained assessor who are blind to the study.

Parkinson's disease

Primary outcomes

1

Description

Performance and satisfaction scores of client-chosen goal

Timepoint

pretest , post test and follow-up (one months after last session)

Method of measurement

Canadian Occupational Performance Measurement (COPM)

Secondary outcomes

1

Description

Goal Attainment

Timepoint

Pretest, post test and follow-up

Method of measurement

Goal Attainment Scale (GAS)

2

Description

Activities of Daily Living

Timepoint

Pretest, post test and follow-up

Method of measurement

Functional Independence Measure (FIM)

3

Description

Fatigue

Timepoint

Pretest, post test and follow-up

Method of measurement

Parkinson Fatigue Scale (PFS)

Intervention groups

1

Description

Intervention group: The intervention group receives the CO-OP approach in 12 sessions of 45-60 minutes and 2 sessions per week. This approach has a specific protocol. The first stage is preparation phase. In this stage, the necessary prerequisites for this approach are checked in the clients and also the purpose of treatment is given to the clients. The first session will be after the preparation phase and is evaluation session. In this session, participants select three performance goals based on the Canadian occupational performance measure Scale (COPM), And they score satisfaction and performance of three goals based on a ten-point scale. The second session will give the necessary explanations about the global cognitive strategy (Goal-Plan-Do-Check) to the clients, the focus of this session is on teaching this global strategy. Sessions three to eleven people acquire skills using these strategies, in these sessions the focus is on learning skills, in these sessions, dynamic performance analysis, guided discovery and the Enabling principles are used continuously, and session twelve Assessments are also performed again.

Category

Rehabilitation

2

Description

Control group: Patients in the control group received conventional occupational therapy. Evidence suggests that these interventions often include stretching and strengthening exercises, improving postural control, improving balance, relaxation techniques, breathing exercises, and gait training.
