Effect of Virtual Reality combined with modified Constraint-Induced Movement Therapy based upper limb training on chronic stroke survivors

Protocol summary

Study aim

To compare effect of virtual reality alone with the combined effect of Virtual reality and modified constraint induced movement therapy on upper limb motor function in stroke

Design

Randomized Control Trial

Settings and conduct

Dar ul Rehmat medical complex, Charsadda. Single blinded

Participants/Inclusion and exclusion criteria

Inclusion Criteria: Ischemic stroke of MCA subjects suffering from stroke for at least 6 months Both genders of age between 40 to 60 years Having at least 10° of active extension of each MCP joint, IP joints of all the digits, and 10° wrist extension of the affected limb Spasticity Grade 1 to 3 according to Modified Ashworth Scale Exclusion criteria: Patients with visual deficits Patients not willing to use virtual reality or CIMT Patients with cognitive disorders Patients with upper limb contracture

Intervention groups

1. Group (I) Virtual reality 2. Group (II) Virtual reality combined with modified constraint induced movement therapy

Main outcome variables

Stroke

General information

Reason for update

Acronym

Upper limb motor function recovery in stroke

Scientific title

Effect of Virtual Reality combined with modified Constraint-Induced Movement Therapy based upper limb training on chronic stroke survivors

Public title

Effect of Virtual Reality combined with modified Constraint-Induced Movement Therapy based upper limb training on chronic stroke survivors

Purpose

Treatment	
Inclusion/Exclusion criteria	
Inclusion criteria:	Ischemic stroke of MCA subjects suffering from stroke for at least 6 months Both genders of age between 40 to 60 years Having at least 10° of active extension of each MCP joint, IP joints of all the digits, and 10° wrist extension of the affected limb Spasticity Grade 1 to 3 according to Modified Ashworth Scale
Exclusion criteria:	Patients with visual deficits Patients not willing to use virtual reality or CIMT Patients with cognitive disorders Patients with upper limb contracture
Age	From 40 years old to 60 years old
Gender	Both
Phase	N/A
Groups that have been masked	Participant
Sample size	Target sample size: 32 Actual sample size reached: 26
Randomization (investigator's opinion)	Randomized
Randomization description	Random assignment for treatment using sealed envelope 26 Sheets of properly cut Aluminum paper double the size of the paper. 26 Sheets of Carbon paper cut into appropriate size according to the paper used. A standard-sized square paper was taken in which group "(VR)" was marked. In this way, 13 papers were prepared marked with "(VR)" and 13 square-shaped papers marked with "(VR+mCIMT)". The sheet of paper on which either (VR) or (VR+mCIMT) was marked was folded to fit the envelope. A sheet of Carbon paper was placed on the top of the folded paper (marked either (VR) or (VR+mCIMT)) facing the envelope. Then the sheet of Aluminum foil was wrapped on the carbon paper (with folded paper inside). All the above prepared were placed in the envelope (which was completely opaque), the envelope was then sealed. In this way 13 envelopes of "(VR)" and 13 envelopes of "(VR+mCIMT)" were prepared. With a total number of 26 envelopes. These 26 envelopes were then thoroughly shuffled like a deck of cards. The envelopes were then marked with numbers 1-26. Each participant picked the envelope in order from 1-26 and was given an intervention (VR or VR+mCIMT) accordingly.
Blinding (investigator's opinion)	Single blinded
Blinding description	Participant don't know about in what group they are. Only the researcher doing the study knows which treatment or intervention the participant is receiving.
Placebo	Not used
Assignment	Parallel

Health conditions studied

1

Description of health condition studied

Stroke

ICD-10 code

I63

ICD-10 code description

Cerebral infarction

Primary outcomes

1

Description

Upper limb motor function

Timepoint

Baseline, 2nd week and 4th week after intervention

Method of measurement

Wolf motor function test

Secondary outcomes

1

Description

Spasticity

Timepoint

4th week

Method of measurement

Modified Ash worth scale

Intervention groups

1

Description

Virtual reality Group: Treatment for 20 min 3 sessions per week for 4 weeks along with the conventional therapy. The VR protocol included using VR headset and the games used were Rally ball and Reflex ridge. In the Rally ball game, balls approaching the player from multiple angles are hit from a chair. The Reflex Ridge game involves hitting, grasping obstacles while sitting in a chair. The patient played each game for 10-mins per session. Conventional therapy includes: passive stretching, repetitive task-specific activities, passive, active-assisted and active ROM exercises

Category

Rehabilitation

2

Description

Virtual reality combined with m-CIMT Group: Treatment for 20 min 3 sessions per week for 4 weeks along with the conventional therapy. The unaffected hand of participant was restrained and then the same VR treatment (as above) given to the participants.
