### Effect of aromatherapy with rosa Damascena essence on nausea and vomiting in patients with breast cancer undergoing chemotherapy

#### Protocol summary

##### Study aim

Determining Effect of aromatherapy with rosa Damascena essence on nausea and vomiting in patients with breast cancer undergoing chemotherapy.

##### Design

Clinical trial with control group, with parallel groups, double-blind, randomized, phase 3 on 76 patients. Allocation software was used for randomization.

##### Settings and conduct

Women with breast cancer referred to Ayatollah Khansari Hospital in Arak will be included in the study if they are eligible and will be randomly divided into two groups of intervention and control. This study will be performed in a double-blind way so that the person who accommodate the provided packet, the person who Assess the outcome of the intervention and data Analyzer are blinded.

##### Participants/Inclusion and exclusion criteria

Inclusion criteria: Age over 18 years. Having a severity of nausea above 3 cm using the 10 cm VAS scale, definitive diagnosis of breast cancer. Healthy sense of smell. Exclusion criteria: History of lung diseases such as asthma, allergies. History of liver and kidney diseases. Having mental illness. Having migraines and chronic headaches.

##### Intervention groups

Intervention group: given 3 pads, a dropper and rose essence with a purity of 40% from Kashan Parsian Company. After chemotherapy it should be taught to pour 6 drops from dropper content on the pad before serving each meal (morning noon Night) for 24 hours. and put it at a 30 cm distance of their nose and inhale its content for 20 minutes normally. Control group: distilled water should be inhaled instead of rose essence in a similar, droppers of the same shape, size.

##### Main outcome variables

Severity of nausea. frequency of vomiting. frequency of retching

##### Scientific title

Effect of aromatherapy with rosa Damascena essence on nausea and vomiting in patients with breast cancer undergoing chemotherapy

#### **Public title**

The effect of aroma with rose damascena essence on nausea and vomiting of chemotherapy

#### **Purpose**

Supportive

#### **Inclusion/Exclusion criteria**

##### **Inclusion criteria:**

Definitive diagnosis of breast cancer by oncologist and pathologist  
Chemotherapy with drugs that cause moderate to severe nausea  
Having a nausea severity above 3 cm using the 10 cm VAS scale  
Healthy sense of smell  
Being over 18 years old

##### **Exclusion criteria:**

Having migraines and chronic headaches  
Having a history of asthma and allergy to rosa damascena  
History of drug and alcohol addiction  
Having mental illness  
Having liver and kidney disease

#### **Age**

From **18 years** old

#### **Gender**

Female

#### **Phase**

3

#### **Groups that have been masked**

- Outcome assessor
- Data analyser

#### **Sample size**

Target sample size: **76**

#### **Randomization (investigator's opinion)**

Randomized

#### **Randomization description**

Samples are entered into the study by non-random (purposive) sampling according to the inclusion criteria. In this study, we will use the Restricted randomization method of block randomization. Blocked randomization is usually used to balance the number of samples allocated to each of the studied groups. This feature helps researchers to equalize the number of samples allocated to each of the studied groups in cases where basic analysis are required during the sampling process. All blocks are the same size, and in this two-group experiment we will have blocks of size 4 (including 2 participants in the intervention group and 2 participants in the control group). Random allocation software is also used for randomization. These random sequence generation software in addition to simple randomization, are able to generate sequences by blocking method. To conceal, we use Allocation concealment, is a technique that ensures that random allocation sequences are performed without knowing which patient will receive which treatment. Using sealed envelopes with random sequence (envelopes opaque, sealed, numbered sequentially), each of the random sequences created is recorded on a card and the cards are placed inside the envelopes. In order to maintain the random sequence, numbering is done on the outer surface of the envelopes in the same way. Finally, the lids of the letter envelopes

are glued and placed inside a box, respectively.

#### **Blinding (investigator's opinion)**

Double blinded

#### **Blinding description**

After obtaining the written consent of the participants, the prepared packages including (dropper containing distilled water, rose essence in the same shape and size as in the paper packages, pads and pins) will be given to the patients after the completion of their chemotherapy. They are taught how to use the contents of the package at home. In this way, there is no communication and contact between the participants of the intervention and control group. No odor from the dropper can be spread in the hospital that cover with a paper box. 1. One who (except researcher) accommodate the provided packets in the same shapes and sizes to the patients, whether the which packet is placebo or intervention is uninformed. 2. The person involved in information analysis is not involved in collecting information after the intervention. 3. The person who contacts the participants to evaluate the outcome of the intervention is unaware of the allocation of participants into two groups.

### **Health conditions studied**

#### **1**

##### **Description of health condition studied**

Chemotherapy-induced nausea and vomiting in breast cancer

**ICD-10 code**  
**ICD-10 code description**

## Primary outcomes

### 1

**Description**

Severity of Nausea

**Timepoint**

15 minutes before the start of chemotherapy (initially study) and 24 hours after the intervention.

**Method of measurement**

Visual Analogue Scale

### 2

**Description**

The frequency of vomiting

**Timepoint**

15 minutes before the start of chemotherapy (initially study) and 24 hours after the intervention.

**Method of measurement**

Rhodes Index

### 3

**Description**

The frequency of retching

**Timepoint**

15 minutes before the start of chemotherapy (initially study) and 24 hours after the intervention.

**Method of measurement**

Rhodes Index

## Secondary outcomes

### 1

**Description**

Amount of vomiting

**Timepoint**

15 minutes before the start of chemotherapy (initially study) and 24 hours after the intervention .

**Method of measurement**

Rhodes Index

### 2

**Description**

Distress score of vomiting

**Timepoint**

15 minutes before the start of chemotherapy (initially study) and 24 hours after the intervention.

**Method of measurement**

Rhodes Index

### 3

**Description**

Distress score of retching

**Timepoint**

15 minutes before the start of chemotherapy (initially study) and 24 hours after the intervention

**Method of measurement**

Rhodes Index

### 4

**Description**

Total score of retching

**Timepoint**

15 minutes before the start of chemotherapy (initially study) and 24 hours after the intervention

**Method of measurement**

Rhodes Index

### 5

**Description**

Total score of vomiting

**Timepoint**

15 minutes before the start of chemotherapy (initially study) and 24 hours after the intervention

**Method of measurement**

Rhodes Index

## Intervention groups

### 1

**Description**

Intervention group: 38 women with breast cancer participated in the study according to the inclusion criteria. Each participant was given a package containing 20ml dropper bottle (containing rose essence prepared by parsian (Medina Al-Nabi) Company with a purity of 40%) , three pads (10 \*10 cm ) and a pin. After completing chemotherapy ,it should be taught to pour 6 drops of dropper bottle content after going to home,which include rose essence of 40%purity on the pad and every given pad for every turn.before serving each main meal(morning, noon, and night) during 24 hours in a 30cm distant of their nose attached to their collar of clothes by a pin.This procedure was performed three times a day (morning, noon, and night). After the intervention (24 hours after chemotherapy), by phone Or face-to-face. Rhodes and VAS questionnaires are filled out to measure nausea and vomiting and sent to the data analyst.
