

Clinical Trial Protocol

Iranian Registry of Clinical Trials

28 Sep 2026

Comparative study of two fluid therapy methods with 5% glucose serum and 5% glucose in lactate ringer on serum glucose, sodium and potassium levels of neonates during and after surgery

Protocol summary

Study aim

Determination and comparison of two methods of fluid therapy with 5% glucose serum and 5% glucose in Ringer lactate on neonatal serum glucose, sodium and potassium levels during and after surgery

Design

In this double-blind randomized clinical trial study with parallel groups, 100 patients were randomly divided into two groups receiving 5% glucose serum and 5% glucose serum in ringer lactated by random allocation software.

Settings and conduct

This double-blind clinical trial study will be performed during 2021-2022 in Al-Zahra Hospital in Isfahan. Fluids are injected into the patient under the supervision of an anesthesiologist, but data collection will be performed by an experienced operating room staff member who is unaware of the infant's fluid therapy.

Participants/Inclusion and exclusion criteria

In this study, infants less than two months old who need surgery and do not have metabolic disorders are included in the study.

Intervention groups

100 baby infants for surgery are distributed in two groups of 50. In the first group, fluid therapy is performed using 5% dextrose serum and in the second group with 5% dextrose serum in ringer lactate.

Main outcome variables

Serum levels of blood glucose, sodium and potassium

Scientific title

Comparative study of two fluid therapy methods with 5% glucose serum and 5% glucose in lactate ringer on serum glucose, sodium and potassium levels of neonates during and after surgery

Public title

Comparison of fluid therapy with 5% glucose serum and

5% glucose in lactated ringer on serum glucose, sodium and potassium levels of infants during and after surgery

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria:

Infant candidate for surgery Age less than 2 months

Parents' consent to participate in the study

Exclusion criteria:

Infant with metabolic disorders

Age

To **2 months** old

Gender

Both

Phase

3

Groups that have been masked

- Participant
- Outcome assessor

Sample size

Target sample size: **100**

Randomization (investigator's opinion)

Randomized

Randomization description

Randomization of patients is done using Random Allocation Software. In this software, the total sample size and number of groups are entered into the software. The software output is a list that randomly distributes the entire sample size between the two groups. Patients are divided into two groups according to the time of referral and according to the mentioned list to complete the sample size.

Blinding (investigator's opinion)

Double blinded

Blinding description

The method of blinding is as follows: Fluids are injected into the patient under the supervision of an anesthesiologist, but data collection will be done by one of the experienced operating room personnel who is unaware of the type of fluid therapy for the infant. Also, the data analyzer is unaware of the type of fluid received.
