The comparison of transforming growth factor beta-1 serum levels in early-stage breast cancer patients treated with external beam whole breast irradiation plus boost versus interstitial brachytherapy accelerated partial breast irradiation

Protocol summary

Study aim
The comparison of transforming growth factor beta-1 serum levels in early-stage breast cancer patients treated with external beam whole breast irradiation plus boost versus interstitial brachytherapy accelerated partial breast irradiation

Design
This is a randomized clinical trial study with parallel groups, will be conducted on 20 patients with early-stage breast cancer (after breast preservation surgery) candidate for adjuvant radiotherapy. Assignment of patients to the study groups will be done by random-numbers table and using computer.

Settings and conduct
This study will be performed on patients with breast cancer candidate for adjuvant radiotherapy in Golestan hospital, Ahvaz. Twenty patients will be randomly assigned to one of radiation therapy groups. In this study only statistical analyzer will not know about patient grouping.

Participants/Inclusion and exclusion criteria
Inclusion criteria: Age more than 45 years, No invasion to the lymphovascular space, No lymphatic involvement, No distant metastasis; Exclusion criteria: Extensive Intraductal Component, Paget disease of the breast or skin involvement, Synchronous tumor or history of breast cancer, History of malignancy, Pregnancy or lactation.

Intervention groups
In the first group, external irradiation of the whole breast plus boost is performed. The prescribed dose to isocenter will be 42.5 Gray in 16 fractions or 50 Gray in 25 fractions or 50.4 Gray in 28 fractions; In the second group, accelerated partial breast irradiation is performed by multi-catheter interstitial brachytherapy with high dose rate. The recommended dose is 32 Gray in 8 fractions twice a day.

Main outcome variables
Serum level of Transforming Growth Factor Beta-1 (TGFB-1)

Scientific title
The comparison of transforming growth factor beta-1 serum levels in early-stage breast cancer patients treated with external beam whole breast irradiation plus boost versus interstitial brachytherapy accelerated partial breast irradiation

Public title
TGFB-1 level in breast cancer patients treated with external beam whole breast irradiation versus accelerated partial breast irradiation
Purpose
Treatment
Inclusion/Exclusion criteria
Inclusion criteria:
Age more than 45 years Unifocal and unicenric breast cancer less than or equal to 3 cm in size (including various histologies of invasive ductal, Papillary, mucinous, tubular, edullary and lobular carcinoma and low to moderate risk intraductal carcinoma) No invasion to the lymphovascular space No lymphatic involvement in invasive histologies No distant metastasis Consent to participate in the study
Exclusion criteria:
Extensive Intraductal Component (EIC) in breast imaging evaluation Paget disease of the breast or skin involvement Synchronous tumor or history of breast cancer History of malignancy 5 years before enrollment Pregnancy or lactation History of collagen vascular disease, or genetic diseases such as ataxia Telangiectasia that leads to increased radiation sensitivity
Age
From **45 years** old
Gender
Female

Phase

No information
Sample size
Target sample size: **20**
Randomization (investigator's opinion)
Randomized
Randomization description
Patients will be assigned into two groups by simple randomization method. Allocation of patients to the study groups will be done by random-numbers table and using computer, and on this basis patients will be included in one of the two treatment groups before starting radiotherapy. The implementation of the random allocation sequence occurs without knowledge of which patient will receive which treatment method.
Blinding (investigator's opinion)
Not blinded

Health conditions studied

1

Description of health condition studied
Breast cancer
ICD-10 code
C50.919
ICD-10 code description
Malignant neoplasm of unspecified site of unspecified female breast

Primary outcomes

1

Description
Serum level of Transforming Growth Factor Beta-1 (TGFB-1)
Timepoint
Before radiotherapy, immediately after the end of radiotherapy and three months after the end of radiotherapy
Method of measurement
Assessment of serum levels of TGF-beta1 by Enzyme-linked immunosorbent assay technique (ELISA)

Secondary outcomes

empty

Intervention groups

1

Description
Intervention group: external irradiation of the whole breast plus boost (photon or electron) is performed. The prescribed dose to isocenter will be 42.5 Gray in 16 fractions or 50 Gray in 25 fractions or 50.4 Gray in 28 fractions.
Category
Treatment - Other

2

Description
Intervention group: accelerated partial breast irradiation is performed by multi-catheter interstitial brachytherapy with high dose rate. The recommended dose is 32 Gray in 8 fractions twice a day with the help of 60 cobalt source.
