

Clinical Trial Protocol

Iranian Registry of Clinical Trials

17 Sep 2026

Comparison of the effectiveness of topical corticosteroid injection and high-level laser therapy in patients with acute post-Anserin bursitis(PAB)

Protocol summary

bursitis, severity of knee pain, quality of life associated with knee pain

Study aim

Comparison of the effect of topical cortico-steroid and high-level laser therapy on pes anserine bursitis thickness, pain intensity of knee and quality of life in patients with acute PAB

Design

A clinical trial with a control group, with parallel groups, single blind, randomized phase 3 will be performed on 60 patients. The envelope method will be used for randomization.

Settings and conduct

This study will be performed to compare two rehabilitation methods in patients with acute pes anserine bursitis in the physical medicine clinic of Besat Hospital in Hamadan. The evaluator will be blinded to the patients' group therapy. Group A will use a gallium arsenide diode laser (model 4 cube-laser-K) with a wavelength of 1064 nm, an output power of 8 watts, and an average energy intensity of 4 joules per square centimeter. Group B will receive a topical injection of corticosteroids under a sono guide of 1 ml of triamcinolone and 1 ml of 2% lidocaine as a single dose.

Participants/Inclusion and exclusion criteria

Inclusion criteria: diagnosis of PAB according to clinical criteria and imaging finding, and age 18-65 years, Non-entry criteria: Comorbidity with rheumatoid arthritis, and treated with corticosteroids at study time or during the last 4 months

Intervention groups

Group A will be use of gallium aluminum arsenide diode laser (model 4 cube-laser-K) with a wavelength of 1064 nm, an output power of 8 watts, and an average energy intensity of 4 joules per square centimeter. The total duration of treatment in each session will be 5-7 minutes for 3 consecutive weeks (5 sessions). Group B will receive topical corticosteroid injections under sono guide 1 ml triamcinolone with 1 ml lidocaine 2% single dose.

Main outcome variables

Pes Anserin changes including thickness, tendonitis and

Scientific title
Comparison of the effectiveness of topical corticosteroid injection and high-level laser therapy in patients with acute post-Anserin bursitis(PAB)

Public title
Treatment of acute post-Anserin bursitis with topical injection of corticosteroids and high-level laser therapy

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
 Diagnosis of PAB according to clinical criteria and imaging by a specialist physician At least 3 months after diagnosis Age 18-65 years Minimum pain intensity according to VAS> 3
Exclusion criteria:
 Comorbidity with other diseases such as: advanced osteoarthritis, infection, neurological and motor diseases (stroke, Parkinson's, myopathies, neuropathies,), other systemic diseases such as rheumatoid arthritis and heart disease History of recent knee surgery or trauma Treatment with corticosteroid now or during the last 4 months

Age
From **18 years** old to **65 years** old

Gender
Both

Phase
3

Groups that have been masked

- Outcome assessor

Sample size
Target sample size: **60**

Randomization (investigator's opinion)
Randomized

Randomization description
We made 60 cards and write letter I on 30 for Intervention and on the other 30 letter C for the control group. Then put them inside the envelope with aluminum wrap and put in a box. At the time of patient arrival, one of the envelopes randomly will be selected and will be opened, based on selected letter I or C patients will be assigned to intervention or control group.

Blinding (investigator's opinion)
Double blinded

Blinding description
The person who asses outcome will be blinded to the patients' group

Placebo
Not used

Assignment
Parallel

Health conditions studied

1

Description of health condition studied

pes anserine bursitis knee

ICD-10 code

M06.26

ICD-10 code description

Rheumatoid bursitis, knee

Primary outcomes

1

Description

Pes anserine bursitis thickness changes

Timepoint

Before treatment, one month later, and three months after treatment

Method of measurement

sonography

2

Description

pain severity of knee

Timepoint

Before treatment, one month later, and three months after treatment

Method of measurement

By Visual Analogue Scale

Secondary outcomes

1

Description

Patients Quality of life

Timepoint

Before treatment, one month and three months after starting treatment

Method of measurement

With SF-12 Quality of Life Questionnaire

Intervention groups

1

Description

Intervention group: One group will undergo high-level laser therapy. For this purpose, gallium aluminum arsenide diode laser (model 4 cube-laser-K) with a wavelength of 1064 nm, an output power of 8 watts, and an average energy intensity of 4 joules per square centimeter will be used. The total duration of treatment in each session will be 5-7 minutes for 3 consecutive weeks (5 sessions).

Category

Rehabilitation

2

Description

Intervention group: The other group will receive a topical injection of corticosteroids. The corticosteroid contains 1 ml of triamcinolone and 1 ml of 2% lidocaine, which will be injected topically into the knee area under the sono guide single dose.
