

Clinical Trial Protocol

Iranian Registry of Clinical Trials

01 Aug 2026

Clinical trial of the effect of low-carbohydrate compared with low-fat diet on metabolic profiles in type 2 diabetes patients with coronary heart disease

Protocol summary

Study aim

The aim of this study is to determine the effects of carbohydrate versus fat restriction on metabolic profiles among type 2 diabetes patients with coronary heart disease (CHD).

Design

Study design: Parallel double-blind (both patients and researchers) randomized controlled clinical trial. Random assignment will be done by the use of computer-generated random numbers.

Settings and conduct

Population and sample size: 56 type 2 diabetes patients with CHD eligible and referred to Cardiology Clinic affiliated to Kashan University of Medical Sciences, Kashan, Iran in the study will be selected.

Participants/Inclusion and exclusion criteria

Inclusion Criteria: Overweight patients aged 40-85 years old and diagnosed with type 2 diabetes and coronary heart disease. Exclusion Criteria: Consuming antiobesity medications within the last 3 months, having an acute myocardial infarction and cardiac surgery within the last 3 months, renal or liver failure.

Intervention groups

Intervention: Patients will be assigned to receive either carbohydrate restriction (n=28) or fat restriction (n=28). Fasting blood samples will be taken at baseline and after 8-wk intervention to measure metabolic profiles. Start and end date of intervention: 8 weeks.

Main outcome variables

Outcomes: Biomarkers of insulin metabolism (primary outcomes), and lipid and metabolic profiles (secondary outcomes) will be quantified at the study baseline and end-of-trial.

General information

Reason for update

Due to an error, the request for an update in our website was conducted after paper published. However, the revisions were accordance with either the original approved proposal or with coordination with Vice Chancellor of Research at the University.

Scientific title
Clinical trial of the effect of low-carbohydrate compared with low-fat diet on metabolic profiles in type 2 diabetes patients with coronary heart disease

Public title
Effect of diet therapy in treatment of Coronary Heart Disease

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
Overweight patients aged 40-85 years old Diagnosed with type 2 diabetes and coronary heart disease
Exclusion criteria:
Consuming antiobesity medications within the last 3 months Having an acute myocardial infarction and cardiac surgery within the last 3 months Renal or liver failure

Age
From **40 years** old to **85 years** old

Gender
Both

Phase
3

Groups that have been masked

- Participant
- Investigator
- Outcome assessor

Sample size
Target sample size: **56**

Randomization (investigator's opinion)
Randomized

Randomization description
At study baseline and after stratification for pre-intervention BMI and age, subjects will be randomly divided into two groups to receive either carbohydrate restriction (n = 28) or fat restriction (n = 28). Randomization will be done by the use of computer-generated random numbers.

Blinding (investigator's opinion)
Double blinded

Blinding description
Participants, investigators or the assessors of the outcomes are unaware of the study groups.
