

Clinical Trial Protocol

Iranian Registry of Clinical Trials

17 Sep 2026

Evaluation of the effect of Pillar flap posterior technique to increase the length of the palate and improve the velopharyngeal insufficiency (vpi) in patients with cleft palate with velopharyngeal insufficiency

Protocol summary

Study aim

Determining the effect of the posterior Pilar Flap technique on the improvement of hyper nasality speech in patients with cleft palate

Design

After obtaining permission from the Medical Ethics Committee of Isfahan University of Medical Sciences, after identifying patients who are candidates for surgery to resolve the VPI problem, first a written consent is obtained from the patients or their companion . Routine treatments and care and preoperative care are provided equally to all patients. The method of blinding will be that the physician who is administrator will perform the posterior pillar flap surgery , but the outcome of the operation is assessed by a skilled speech therapist who is not in the study. Only one group without randomization and one way blind without control group

Settings and conduct

patients enter the study at the time of admission to the hospital and fulfill the necessary conditions, respectively. It is a clinical trial without a control group that is performed in 1400&1401 in Al-Zahra Hospital in Isfahan

Participants/Inclusion and exclusion criteria

A patient with a hypernasality speech due to cleft palate, who is satisfied to participate in the study, and the patient's who discotinue subsequent visits to determine the state of recovery means leaving the study

Intervention groups

After being placed on the operating table, patients are subjected to cardiorespiratory monitoring and under general anesthesia, the posterior pillar flap operation is performed on them. In this technique, the posterior posterior mucosa of the flap is opened and the nasal mucosa is separated by z-plasty. The length of the palate is increased and the oral and nasal mucosa are repaired as a duct. Postoperative care is provided for all patients and in addition training the necessary care to the patient

Main outcome variables

Correct patients' speech

Scientific title
Evaluation of the effect of Pillar flap posterior technique to increase the length of the palate and improve the velopharyngeal insufficiency (vpi) in patients with cleft palate with velopharyngeal insufficiency

Public title
Improving the complication of nasal speech in patients with cleft palate by increasing the length of the palate with a new surgical method

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
 Patient with nasal talk disorder due to cleft palate Do not have a lung infection and ear, nose and throat area during the operation Patient or companion consent to participate in the study
Exclusion criteria:
 Lack of subsequent patient visits to determine recovery status

Age
No age limit

Gender
Both

Phase
N/A

Groups that have been masked
No information

Sample size
Target sample size: **35**

Randomization (investigator's opinion)
N/A

Randomization description

Blinding (investigator's opinion)
Double blinded

Blinding description
The method of blinding will be that the physician performing the posterior pyloric flap surgery is performed, but the outcome of the operation is assessed by a skilled speech therapist who is not in the study.

Placebo
Not used

Health conditions studied

1

Description of health condition studied

hyper nasal speech in cleft palate

ICD-10 code

Q00-Q99

ICD-10 code description

Congenital malformations,defomations and chromosomal abnormalities

Primary outcomes

1

Description

Percentage of people with improved speech in the nose after surgery

Timepoint

6 months and one year after surgery

Method of measurement

Nasoendoscopy and fluoroscopy and speech therapy

Secondary outcomes

1

Description

Vpi intensity

Timepoint

6 months and one year after surgery

Method of measurement

Nasoendoscopy and fluroscopy

Intervention groups

1

Description

Intervention group: Fluoroscopy, nasovandoscopy, and preoperative and postoperative speech therapy, as well as post-operative bed rest, are monitored by cardiorespirators, and under general anesthesia, the posterior pillar-flap operation is performed on them. In this technique, the posterior posterior mucosa of the flap

is opened and the nasal mucosa is separated by z-plasty. The length of the palate is increased and the oral and nasal mucosa are repaired as a duct.
