Studying the effect of Tamsulosin on postoperative urinary retention in patients undergoing Inguinal hernia repair under spinal anesthesia at IMam sajjad hospital in 2022

Protocol summary

Study aim

Studying prevalence of post operative urinary retention in 2 groups of placebo and tamsulosin and comparing urinary retention of 2 groups

Design

Prospective randomized double-blind placebo-controlled trial

Settings and conduct

All subjects were NPO (nil per os) about 8 hours before the surgery, and during this time, they were given 1 liter of 1/3 2/3 intravenous fluids. They were asked to empty their bladder prior to surgery. All participants went under spinal anesthesia with 2 cc of Marcaine. During the surgery they all received 1 liter of normal saline 0.9% intravenously. The following 4-6 hours after surgery, they were maintained NPO and received another 1 liter of 1/3 2/3. Following surgery, all subjects were closely monitored for 24 hours by the responsible nurse and the surgeon in case of developing POUR. Urinary retention was diagnosed if the subject was unable to urinate in the presence of palpable bladder in 24 hours postoperatively, so foley catheterization was performed to relieve patient's discomfort.

Participants/Inclusion and exclusion criteria

Inclusion criteria: age older than 50 years old; unilateral inguinal hernia; being candidate for spinal anesthesia. Exclusion criteria: orthostatic hypotension; strangulated hernia; need for other surgery at the same time.

Intervention groups

Enrolled participants are randomly assigned into two groups. Group A (50 subjects) received 0.4 mg Tamsulosin 8 hours prior to operation, group B (50 subjects) received placebo a gelatinous capsule containing lactose in similar shape and appearance as Tamsulosin 8 hours prior to operation.

Main outcome variables

Postoperative urinary retention

Scientific title

Studying the effect of Tamsulosin on postoperative urinary retention in patients undergoing Inguinal hernia repair under spinal anesthesia at IMam sajjad hospital in 2022

Public title

Studying the effect of Tamsulosin on postoperative urinary retention in patients undergoing inguinal hernia repair under spinal anesthesia

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria:

Age older than 50 years old Unilateral inguinal hernia Candidate for spinal anesthesia

Exclusion criteria:

Bilateral hernia Strangulated hernia General anesthesia Prostate cancer BPH Orthostatic hypotention Concurrent surgery

Age

From **50 years** old

Gender

Male

Phase

2-3

Groups that have been masked

- Participant
- Care provider
- Outcome assessor

Sample size

Target sample size: **100**

Randomization (investigator's opinion)

Randomized

Randomization description

In this study, block randomization will be used to generate a random sequence. The size of the blocks is selected randomly (blocks of 6 and 4). Each block contains an equal number of each group. Random sequence generation software will be used to generate random sequences. To hide random allocation, opaque envelopes sealed with random sequences will be used. Each random sequence is recorded on a card, and the cards are placed in the envelopes of the order, respectively. In order to maintain a random sequence, the envelopes are numbered in the same way on the outer surface. At the beginning of the registration of participants, based on the order of entry of eligible participants into the study, one of the envelopes of the letter is opened and the assigned group of the participant is revealed.

Blinding (investigator's opinion)

Double blinded

Blinding description

Enrolled patients and the responsible nurse for providing the medications are unaware of the type of medicine used for their case.

Health conditions studied

1

Description of health condition studied

Post inguinal hernioplasty urinary retention

ICD-10 code

K40.9

ICD-10 code description

Unilateral inguinal hernia, without obstruction or gangrene

Primary outcomes

1

Description

Post operative urinary retention

Timepoint

In the next 24 hours after surgery

Method of measurement

Ability to urinate

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: patients inguinal hernia is confirmed by physical examination or sonography. All patients are kept NPO(nil per os) 8 hours before the surgery and they receive 1 liter of dextrose saline solution . They receive

tamsulosin 0.4 mg from Abidi company 8 hours before the surgery and 6,12 hours after the surgery .
