The Effect Of Painting Compared with Routine medical care in Hospital On Anxiety Of Hospitalized Children Aged 6 To 12 years old

Protocol summary

Summary

The present study determines effect of painting on anxiety of hospitalized children. Study population is children aged 6 to 12 years old that are hospitalized at Tehran children's medical center. Sample size consists of 72 children who were hospitalized for 6 days without receiving any tranquilizer. Participants through applying simple random sampling are divided into 2 groups (experimental group and control group) consisting of 36 persons. The intervention was painting with free topic at experimental group. Control group is similar to experimental group but control group only benefit from routine medical care in Hospital. Immediately upon performing intervention, it is applied from the Revised Children's Manifest Anxiety scale in order to assess level of child's anxiety.

Intervention groups

1

Description

The experimental group has 36 children aged 6 to 12 years old. The topic is free painting at experimental group. The equipment offered to child is including: paper, colorful pencil, and crayon in different colors. The painting intervention is performed for 5 consecutive days each session lasting for 25min to 35min. The criterion of assessing anxiety in this research is the Revised Children's Manifest Anxiety scale that was completed before the first intervention and after the final intervention.

Category

Treatment - Other

2

Description

The control group consisting of 36 children aged 6 to 12 years is similar to experimental group and only intervention is not performed for them. They only benefit from routine medical care in hospital.
