

Clinical Trial Protocol

Iranian Registry of Clinical Trials

11 Jun 2026

Comparison of the early skin toxicity and cosmetic outcome of concomitant boost radiotherapy with sequential boost radiotherapy after breast cancer conserving surgery

Protocol summary

Study aim

Assessment of the possibility of shortening the duration of breast cancer radiation therapy without increasing the side effects

Design

This is a phase 2 randomized clinical trial. The patients are randomized into two groups of concomitant boost and sequential boost. 50 patients are needed in each group (confidence interval 95%, power of 90%).

Randomization was done with permuted block method.

Settings and conduct

This study was done at radiation oncology ward , cancer institute, Imam Khomeini hospital complex, Tehran university of medical sciences

Participants/Inclusion and exclusion criteria

18-75 years olds women with pathology proven breast cancer who have undergone breast conserving surgery would be included in the study. Those with the previous radiation therapy, previous cancer, previous skin disease, positive margin on surgery, or multi focal disease are excluded from the study.

Intervention groups

Radiotherapy with concomitant boost technique

Main outcome variables

Acute skin side effects and cosmetic outcome after 6 month and 1 year after radiation completion.

Scientific title

Comparison of the early skin toxicity and cosmetic outcome of concomitant boost radiotherapy with sequential boost radiotherapy after breast cancer conserving surgery

Public title

Effect of boost technique on toxicity of breast cancer radiotherapy

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Women with pathologically proven breast cancer Age 18-75 Undergoing breast conserving surgery Early staged breast cancer (T1-3,N0-1)

Exclusion criteria:

Previous skin disease Previous breast radiation Previous cancer Positive margin on surgery Multifocal disease

Age

From **18 years** old to **75 years** old

Gender

Female

Phase

2

Groups that have been masked

No information

Sample size

Target sample size: **100**

Actual sample size reached: **82**

Randomization (investigator's opinion)

Randomized

Randomization description

Randomization was done with permuted block method. In blocks with different sizes, patients were randomly assigned to two groups of concomitant boost and sequential boost by using random number tables.

Health conditions studied

1

Description of health condition studied

Breast cancer

ICD-10 code

C50

ICD-10 code description

Malignant neoplasms of breast

Primary outcomes

1

Description

Acute skin toxicity of breast radiotherapy

Timepoint

Weekly during radiotherapy

Method of measurement

Physical exam and grading the skin side effects via Common Terminology Criteria for Adverse Events version 4

2

Description

Cosmetic outcome

Timepoint

6 and 12 months after radiotherapy

Method of measurement

Physical exam and scoring according to Harvard criteria

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: Concomitant boost with 10 Gray in 5 fraction, one session every weekend.

Category

Treatment - Other

2

Description

Control group: Sequential radiation boost, 10 Gray in 5 fraction at the end of radiation program.

Category

Treatment - Other
