Evaluation of glycemic index of bread based on cumin in healthy individuals

Protocol summary

Study aim

Evaluation of glycemic index of bread containing cumin in healthy individuals

Design

A trial with a control group, with parallel, double-blind, randomized groups, is performed on 20 healthy individuals. randomization method is Stratified
Intervention group: Bread prepared from cumin Control group: ordinary bread

Settings and conduct

The study will be conducted at the Yazd Diabetes Research Center. First, on 3 separate days, at least one day apart, everyone receives 50 grams of glucose dissolved in a cup of tea as a standard meal. On the fourth day of the study, individuals are randomly divided into two equal groups. The first group eats 100 grams of bread made from whole wheat flour and the second group eats 100 grams of bread designed based on a mixture of whole wheat flour and 2% cumin powder (Bread prepared from cumin) with a cup of tea. Every 4 days of the test, fasting blood sugar will be measured with a glucometer at 15, 30, 45, 60, 90 and 120 minutes after eating.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Age: 20 to 45 years No known disease
Body mass index in the range of 18-25 Exclusion criteria: FBS>105 mg/dl Smoker Opioid addiction Pregnancy and Breast feeding special diet Professional sports exercises
Metabolic disorders Taking drugs that affect blood glucose metabolism

Intervention groups

Intervention group: Bread prepared from cumin Control group: ordinary bread

Main outcome variables

Glycemic index

Scientific title

Evaluation of glycemic index of bread based on cumin in healthy individuals

Public title

Determination of glycemic index of bread containing cumin

Purpose

Prevention

Inclusion/Exclusion criteria**Inclusion criteria:**

Age: 20 to 45 years No known disease Body mass index in the range of 18-25

Exclusion criteria:

FBS>105 mg/dl Smoker Opioid addiction Pregnancy and Breast feeding special diet Professional sports exercises Metabolic disorders Taking drugs that affect blood glucose metabolism

Age

From **20 years** old to **45 years** old

Gender

Both

Phase

N/A

Groups that have been masked

- Participant
- Care provider
- Outcome assessor
- Data analyser

Sample size

Target sample size: **20**

Randomization (investigator's opinion)

Randomized

Randomization description

In terms of gender, age and body mass index, stratified randomization is performed. First, we prepare a complete list of volunteers to participate in the study, then based on age, sex and body mass index, it will be divided into three groups and randomization will be done in each layer. Finally, based on the above criteria, we will have two groups of random and layered.

Blinding (investigator's opinion)

Double blinded

Blinding description

In this study, only the main researchers are aware of the type of bread. The participating volunteers and other people involved in the project have no information about the type of bread. Both breads are similar in terms of shape, color, smell, packaging and appearance, and blinding has been done between them.

Healthy people

ICD-10 code**ICD-10 code description****Primary outcomes****1****Description**

Glycemic index

Timepoint

Measurement of fasting blood glucose and times of 15, 30, 45, 60, 90 and 120 minutes after eating glucose solution and each of the breads, in four non-consecutive days

Method of measurement

Using glucometer device and formula

Secondary outcomes

empty

Intervention groups**1****Description**

Intervention group: Bread made from whole wheat flour and cumin- Flour composition includes 96% whole wheat flour + 2% cumin powder + 2% The rest includes dough and permitted bread additives such as salt and standard ingredients to improve the quality of bread, which is turned into bulk bread in "Golnan Puratos" factory.
