Comparison of two and twenty four hour treatment with salt in infant's Umbilical Granuloma

Protocol summary

Summary

One of the most common umbilical problems in neonates is umbilical granuloma, causing inflammation and drainage. This study was carried out to compare the effect of 2 and 24 hours salt (NaCl) in the treatment of neonatal umbilical granuloma. This is a controlled clinical trial study, done at neonatal NICU and infant Follow-up clinic of Emamreza hospital, Mashhad university of Medical sciences. 40 Neonates were randomly assigned to one of two groups. Group 1, including 20 infants with umbilical granuloma was undergone 24 hours treatment with salt group 2, including 20 infants was undergone 2 hours treatment with salt. In the first the salt was not washed out and or cleaned during this period. In the second group, the salt was washed by boiled water every 2 hours. The neonates were visited every day and healing process will be recorded. If there was no sign of healing, treatment with salt was continued until full recovery. Separation of umbilical cord and side effects was compared between two groups.

Health conditions studied

1

Description of health condition studied

umbilical granuloma

ICD-10 code

P38

ICD-10 code description

Omphalitis of newborn with or without mild haemorrhage

Primary outcomes

1

Description

healing time of granuloma

Timepoint

Baseline and everyday till improvement of granuloma

Method of measurement

Observation of healing time by researcher

2

Description

Separation of umbilical cord

Timepoint

daily

Method of measurement

by observation

3

Description

side effects

Timepoint

daily

Method of measurement

Observation of redness, irritation, or inflammation

Secondary outcomes

empty

Intervention groups

1

Description

Granuloma was irrigated with boiled water and then was
covered with powder of salt every 24 hours

Category

Treatment - Other

2

Description

Granuloma was irrigated with boiled water and then was
covered with powder of salt every 2 hours
