Effectiveness of Aerobic Exercises as an Adjunctive Therapy In Depression: A Randomized Controlled Trial

Protocol summary

Study aim

this study aim is to compare the effectiveness of aerobic exercises as an adjunctive therapy along with antidepressants on depression.

Design

In this observer blinded Randomised Controlled Trial, total 32 patients with depression were recruited via consecutive sampling. Both groups were having equal number of patients that is 16 in each.

Settings and conduct

I-fitness Gym of Iqra National Univeristy Peshawar Pakistan

Participants/Inclusion and exclusion criteria

This study will include patients (both male and females) with mild to severe depression of age 18-35. Patients who resided in Peshawar Pakistan and had an easy access to the aforementioned clinic or the i-fitness gym of Iqra National University, Peshawar Pakistan will be included. Patients who had participated in any other clinical study/trial at the time the present study will be excluded patients who is involved in any sporting or exercise activity at the time of this study conduction or anyone who could not participate in any physical activity or had any other psychiatric or physical disorder will be excluded from this study. Patients who had been taking any antipsychotic drugs or psychotherapy within last 3 months before the commencement of the present study will also be excluded.

Intervention groups

The experimental group received aerobic exercises and antidepressants while the controls received only antidepressants for 8 weeks.

Main outcome variables

The primary outcome measures were Hamilton Depression rating scale (HDRS) and Beck Depression Inventory-II (BDI-II).

Randomization (investigator's opinion)

Randomized

Randomization description

After meeting the inclusion criteria and filling a written informed consent, a total of 32 patients will be enrolled in this study. These participants will be randomly allocated into two groups namely; the Experimental group (aerobic exercises and antidepressants) and the Control group (antidepressants only). The random allocation will be performed using sealed envelope (opaque). Total 32 envelopes will be prepare, 16 will have a paper with group A (control group: antidepressants) written on it and 16 will have group B (experimental group: aerobic exercises and antidepressants). This will be for equal distribution of subjects in the two groups. Each participant will be asked to pick an envelope and he/she will hand over the envelop to the researcher. Participants were not blinded about their allocation as it was not possible. All the participants were well informed about the goals and intervention of the study by providing detailed

Blinding (investigator's opinion)

Single blinded

Blinding description

the investigator was unaware of the patient level of depression and of the detail of weather the patient is in the control group or experimental group.
