Comparative effectiveness of Maitland versus Mulligan mobilization technique for post-surgical mobility complications of distal radius fracture

Protocol summary

Study aim

To compare the effects of Maitland and Mulligan mobilization for post-surgical mobility complications of distal radius fracture and change the quality of life of participants after the treatment and reduce pain and increase functional mobility

Design

A single blinded randomized controlled trial having lottery method and simple convenient sampling

Settings and conduct

Patients were taken from Madinah Teaching Hospital (MTH) Faisalabad, District Headquarter Hospital (DHQ) Faisalabad and Allied Hospital Faisalabad. Group A patients received Maitland mobilization technique and Group B patients received Mulligan (MWM) technique while moist heat was given to both of the groups as a baseline treatment.

Participants/Inclusion and exclusion criteria

Subjects having distal radius fracture and who are gone through the process of open reduction and internal fixation. Moreover, participants whose cast has been removed after two months following the surgery of distal radius fracture. Participants having functional limitation and pain and with an average of about 30 to 60 years are included in the study. Exclusion criteria includes: • Osteopinea, Malunion of the fracture, Pre-existing inflammatory condition of the joints, Prolong steroid usage, Bony block, Hypermobility, Joint effusion, Haemarthrosis, Sudeck's dystrophy, Complex regional pain syndrome, Infection, Impaired sensation or circulation, Fracture site other than distal radius

Intervention groups

Group A (Maitland mobilization group)=Hot pack 15 minutes (baseline treatment) Maitland grade 1 and 2 (first two weeks) Grade 3 and 4 (next two weeks) Group B (Mulligan mobilization group)=Hot pack 15 minutes (baseline treatment) Mulligan mobilization (medial,

lateral, anterior and posterior directions) (four weeks)

Main outcome variables

Pain, range of motion and functional limitation of wrist

Scientific title
Comparative effectiveness of Maitland versus Mulligan mobilization technique for post-surgical mobility complications of distal radius fracture

Public title
Comparative effectiveness of Maitland versus Mulligan mobilization technique for post-surgical mobility complications of distal radius fracture

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
Participants having distal radius fracture Participants undergone through the process of open reduction and internal fixation Participants whose cast has been removed after two months following surgery Participants willing to take part in the research Participants whose wrist mobility is restricted Participants having pain from 3 to 7 on VAS Participants having age from 30 to 60 years

Exclusion criteria:
Participants gone through the procedure of close reduction for fixing the fracture Osteopinea Malunion of the fracture Pre- existing inflammatory condition of the joints Prolong steroid usage Bony block Hypermobility Haemarthrosis Sudeck's dystrophy Complex regional pain syndrome Infection Impaired sensation or circulation Joint effusion

Age
From **30 years** old to **60 years** old

Gender
Both

Phase
N/A

Groups that have been masked

- Participant

Sample size
Target sample size: **32**

Randomization (investigator's opinion)
Randomized

Randomization description
The participants are allocated using simple randomization into two separate groups. The tools used in randomization are sealed envelopes, and allocation concealment was carried out. The randomization was done on an individual basis.

Blinding (investigator's opinion)
Single blinded

Blinding description
The participants will be unaware in which group they will be allocated after meeting the inclusion criteria an informed consent will be taken from them by the physiotherapist.

Placebo

Health conditions studied

1

Description of health condition studied
In the forearm region of upper extremity radius is the bone which is located on the lateral side of the forearm alongside ulna. The distal part of the radius is that part which is connected to the wrist. If any break or discontinuity comes in this part of the radius then it is usually referred to as fracture of the distal radius, and this fracture usually takes place when a person falls on an outstretched hand leading to impact of the wrist to the floor and resulting in fracture. This fracture can also take place if a person falls while the wrist is in a flexed position. It is also very common among people of older age and athletes. Complications such as impaired circulation, malunion, infection and complex regional pain syndrome can also occur after this fracture.

ICD-10 code
M84.333

ICD-10 code description
Stress fracture, right radius

Primary outcomes

1

Description
Pain in the distal part of radius as a result of fracture is the primary outcome

Timepoint
Pain will be measured at the start of the treatment sessions and then after four weeks when the treatment

sessions are finished

Method of measurement

Visual analogue scale will be used to measure pain

Secondary outcomes

1

Description

Range of motion and functional limitation of wrist

Timepoint

Range of motion and functional limitation of wrist will be measured before the treatment sessions and after four weeks when all the treatment sessions are given

Method of measurement

Goniometer and PRWE questionnaire will be used to measure the range of motion and functional limitation

Intervention groups

1

Description

Intervention group 1: Maitland mobilization (The participants present in this group first of all received heat using hot pack for a duration of about fifteen minutes as baseline treatment. After this making sure that the muscles were completely relaxed grade 1 and grade 2 of Maitland mobilization was applied to the wrist. These two grades were applied for first two weeks. After these two weeks the level of grade was increased to grade 3 and grade 4 and these two grades of Maitland mobilization were applied for the next two weeks).

Category

Rehabilitation

2

Description

Intervention group 2: Mulligan mobilization (The participants present in this group also first of all received heat using hot pack for a duration of about fifteen minutes as baseline treatment. After this making sure that the muscles were relaxed mobilization with movement technique of Mulligan mobilization was applied to the participants in the antero-posterior direction, medial direction and lateral direction at the level of the distal radio-ulnar joint. These mobilization techniques were applied for a time duration of about four weeks).
