Groups that have been masked

- Data analyser

Sample size
Target sample size: **64**

Randomization (investigator's opinion)
Randomized

Randomization description
Considering that at the beginning of the study, the quality of sleep of the elderly is measured as a criterion for inclusion in the study, the score obtained from the questionnaire is arranged from small to large and placed in 2 blocks (one letter A and one letter B) and allocated as Classified will be executed. First, we will form a random sequence of 64 letters in double blocks as follows: BA-AB-AB-BA-AB-BA-AB-AB-BA-AB-BA-BA-AB-AB-BA-AB- BA-AB-AB-BA-AB-BA-AB-AB-BA-AB-BA- BA-AB-AB-BA-AB In this random sequence, there will be 32 of each letter A and B. According to the above block, 64 envelopes will be prepared and in each envelope, the letter A or B will be placed and will be numbered from 1 to 64. The person delivering the envelopes to the patients does not know what is inside. The production of a random sequence is done by a statistics and methodology consultant who does not have access to patients and only he knows what is in each envelope. Patients who received the letter A will be in the intervention group and patients who received the letter B will be in the control group.

Blinding (investigator's opinion)
Single blinded

Blinding description
The analyst does not know the names of the patients and how to complete the questionnaire and the scores of the people.
