

Clinical Trial Protocol

Iranian Registry of Clinical Trials

14 Jul 2026

The effect of group narrative therapy on sense of coherence and social stigma associated with traumatic spinal cord injury

Protocol summary

Study aim

Determining the effect of narrative therapy on psychological cohesion and social stigma associated with traumatic spinal cord injury

Design

The type of randomized controlled trial will be without blinding in which there will be an experimental group and a control group. The design of the present study will be a parallel design with the control group with random assignment of subjects. Taking into account fifteen ten percent loss, we consider at least 16 samples in each group before and after the intervention.

Settings and conduct

After obtaining the code of ethics and permission from the university, he will refer to the research environment and take samples from the officials of the research environment. Then, by installing a call in the research environment, patients with traumatic SCI are invited to cooperate. For patients who wish to participate in the study, the goals of work will be explained and written consent will be obtained from them. Sampling will be done by available method. Sampling will be done by available method. Then the samples will be randomly divided into two group. The members of the experimental group will then receive the treatment narrative, but the members of the control group will not receive any advice. At the end of the sessions, members of both groups will complete the questionnaires.

Participants/Inclusion and exclusion criteria

Willingness to participate in the study Literacy Age 18 years and older No mental illness

Intervention groups

Intervention group: The effectiveness of narrative therapy on psychological cohesion and social stigma of spinal cord injury patients, which will be done within a month (8 sessions) - Control group: do not receive any psychotherapy

Main outcome variables

sense of coherence- social stigma

Intervention groups

1

Description

Intervention group: Intervention group: The treatment protocol of narrative therapy sessions will be performed in two sessions per week and in 8 90-minute sessions in a group manner in the counseling room of Tabriz Welfare Office according to the treatment plan of Michael White and Epston 1 (1990). The description of the narrative-therapy sessions will be as follows: Session 1: Introduction, presentation of intervention schedule, number of sessions, time interval of sessions, expectations from the group, introduction of skills, goal statement, comprehensive evaluation, creating a good relationship, familiarity with narrative therapy, work sample, life narration and storytelling; Second: Objectification and externalization of the problem, naming the problem, identifying the problematic words and beginning of metaphorization ; From the problem by the exceptions of life, narrative analysis, attitudes toward the problem and the interactions between the individual and the problem; Session 5: Reconstruction stage: new metaphors, mental representations of life situations with new metaphor, creation of reality by the individual and the beginning of narration; Session 6: Enrichment of the new story using unique strategies, examining the story and its meaning to the future; : Living in a new story, answering questions and rewriting past stories; Session 8: Examining the meaning of life, external documentation, enriching and encouraging the person to continue the story, post-test and end of treatment Prior to randomization and intervention, all samples will complete the research questionnaires in order to ensure the same chance of selection in each individual. Then, the members of the experimental group will receive the narrative-therapy narrative as a group by the researcher in 8 sessions of 1.5 hours (2 months). After the sessions, they will complete the questionnaire of psychological cohesion and social stigma again. This (post-test implementation) will be done to evaluate the effectiveness of the independent variable (narrative therapy) on the dependent variables (psychological cohesion and social stigma).
