effects of virtual rehabilitation on upper extremity motor learning in hemiplegic cerebral palsy

Protocol summary

Study aim

To investigate the effects of virtual rehabilitation on upper extremity motor learning in patients with hemiplegic cerebral palsy

Design

A single blinded randomized controlled trial and Purposive sampling technique is used. The sample size was twenty five enrolled between May 2022 to July 2022

Settings and conduct

Patients were taken from Allied hospital Faisalabad and Madina teaching hospital Faisalabad. Group A patients received regular physiotherapy and virtual rehabilitation while Group B patients received physiotherapy sessions. Only the researcher knew which group received regular therapy and other received virtual therapy

Participants/Inclusion and exclusion criteria

- Patients between 5 to 10 years old
- Diagnosed as hemiplegic cerebral palsy Both genders will include
- Patients with visual impairments and auditory problem
- Patients with severe spasticity (Modified Ashworth spasticity score of 4) were excluded from the study
- patients with Psychological illness
- patients Suffered from uncontrolled seizures

Intervention groups

Patients in the intervention group will be given through regular physiotherapy as well as virtual rehabilitation. The UE VR training sessions will be 2 times each week for 8 weeks (2 months). For training, non-Immersion Microsoft Xbox Kinect will be used. In Intervention sessions each child will participate in a total of 16 sessions of 40 min each. In control group patients will underwent routine physiotherapy program. The protocol includes passive stretching and strengthening exercises. Each exercise will takes place for 20 minutes 10 repetitions, twice a week, for 8 weeks.

Main outcome variables

To improve the motor functions of upper extremity To improve range of motion to increase muscle strength and decrease limited activity To improve reaching ability and

grasping function

Scientific title

effects of virtual rehabilitation on upper extremity motor learning in hemiplegic cerebral palsy

Public title

effects of virtual rehabilitation on upper extremity motor learning in hemiplegic cerebral palsy

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

Patients between 5 to 10 years old Diagnosed as hemiplegic cerebral palsy Both genders will include Being able to cooperate and being motivated will include in the study Patients who are able to understand and clearly follow verbal instructions and command that include in training and evaluation. Patients with Gross Motor Function Classification Scale level 1, 2 and 3 will include

Exclusion criteria:

Patients with visual impairments and auditory problem Patients with severe spasticity (Modified Ashworth spasticity score of 4) excluded from the study Patients with Psychological illness Participants Suffered from uncontrolled seizures Patients injected with Botulinum toxin injections within past three months were excluded Patients having prior surgery for spasticity within past 3 months were excluded from study

Age

From **5 years** old to **10 years** old

Gender

Both

Phase

N/A

Randomization (investigator's opinion)

Randomized

Randomization description

The method used for randomization was simple randomization. The randomization unit was done on an individual basis. A computer software randomized tool is used.

Blinding (investigator's opinion)

Single blinded

Blinding description

the participants will be unaware in which group they will be allocated after meeting the inclusion criteria an informed consent will be taken from them by physiotherapist.

Placebo

Health conditions studied**1****Description of health condition studied**

Cerebral palsy is a prevalent neurodevelopmental disorder that ranging from 1.5 to 2.5/1000 births beginning in the early childhood and continues throughout life. It causing the non-progressive disturbance of motor function that influences posture and movement, motor coordination with secondary complications of contractures and bone deformity. These alternations leading to hindrance in independent performance of daily activities

ICD-10 code

G80.9

ICD-10 code description

Cerebral palsy, unspecified

Primary outcomes**1****Description**

spasticity and impaired range of motion in the upper extremity

Timepoint

motor function will be measured at start of treatment sessions and after eight weeks after treatment sessions finished

Method of measurement

modified ashworth scale will use

2**Description**

motor dysfunction in the upper limb

Timepoint

motor function will be measured at start of treatment

sessions and after eight weeks after treatment sessions finished

Method of measurement

ABILHAND - KIDS and PMAL scale will use

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group Patients in this group will be given through regular physiotherapy as well as virtual rehabilitation. The Upper extremity Virtual Rehabilitation training sessions will be two times each week for eight weeks (2 months). For training, non-Immersion Microsoft Xbox Kinect will be used. The Xbox-Kinect display place used an infrared camera to detect handlers' physical motions in 3-D space for interactive activities inside the game, eliminating the requirement for the user to carry an interface device. In Intervention sessions each child will participate in a total of sixteen sessions of forty minute each.

Category

Rehabilitation

2

Description

Control group: In this group patients will underwent routine physiotherapy program. The protocol includes passive stretching and strengthening exercises. On the affected side, the therapist will use resistance to strengthen the muscles. Each exercise will takes place for 20 minutes 10 repetitions, twice a week, for 8 weeks
