Comparison of the efficacy of two fluoride mouthrinses on Streptococcus mutans of saliva

Protocol summary

Summary

Introduction: Two common mouth rinses in markets are Oral-B solution and Irsha solution. The goal of this study is the comparison of the efficacy of Oral-B and Irsha fluoride mouth rinses on Streptococcus mutans. This is a randomized, single blind trial. 60 healthy girl students studying in high school with no history of taking antibiotics during recent 6 months, good oral health (at least two times of tooth brushing a day), and without rampant caries will recruit. Exclusion criteria are discontinuation of cooperation during study, and also involvement by any kind of disease and subsequent antibiotic administration during study. These girls are completely aware about the contribution in the research program and written informed consent is taken from them. These 60 students randomly allocated into two equal groups of 30 individuals. Intervention is consumption of Oral-B and Irsha mouth rinse ,so Oral-B mouth rinse is given to one group and Irsha mouth rinse is given to another group and they are asked to use mouth rinse as long for 4 weeks, twice a day(before tooth brushing ,after breakfast and dinner .Outcome measure is counting colonies of Streptococcus mutans, so saliva of each person is collected before and after using mouth rinse and is sent to laboratory for microbial cultures. Finally data is analyzed by T-test in the 0.95 confidence.
