Effectiveness of muscle strengthening exercises on pain, physical function and morning stiffness of patients with osteoarthritis of knee : a randomized four-arm controlled trial

Protocol summary

Study aim

Determining the effectiveness of knee strengthening exercises on pain, physical function and morning stiffness of osteoarthritis of knee

Design

A clinical trial with three intervention groups and one control group, conducted on 96 patients with osteoarthritis of knee. Random sequence of 1:1:1:1 was made using Stratified, Blocked randomization (blocks of 4 and 8) by Microsoft Excel, using the RAND function.

Settings and conduct

The location of the trial was in the Rheumatology Clinic of Vali-e-Asr Hospital, Zanjan, Iran. The intervention groups performed muscle strengthening exercises around the knee joint regularly 5 days a week for 8 weeks (3 sets/day, 10-15 repetitions). Data analysts and the outcome assessor were masked.

Participants/Inclusion and exclusion criteria

Patients aged 40-70 years with osteoarthritis of knee were included in the study. simultaneous suffering from musculoskeletal diseases other than knee osteoarthritis, history of knee joint surgery, intra-articular injection of corticosteroids or hyaluronic acid in the knee joints, use of non-steroidal anti-inflammatory drugs Steroids (NSAIDs) or use of glucosamine, participating in knee joint muscle strengthening programs were considered exclusion criteria.

Intervention groups

Including three intervention groups and one control group. The first group (G1) underwent quadriceps strengthening exercises, the second group (G2) received hamstring strengthening exercises, the third group (G3) performed strength aimed at strengthening both quadriceps and hamstring muscles groups and control group (G4) received no interventions during this period.

Main outcome variables

Score of knee pain on Visual Analogue Scale (VAS) score,

Score of knee physical function on the Western Ontario and McMaster (WOMAC) Index, Score of knee morning stiffness on the Western Ontario and McMaster (WOMAC) Index

Scientific title

Effectiveness of muscle strengthening exercises on pain, physical function and morning stiffness of patients with osteoarthritis of knee : a randomized four-arm controlled trial

Public title

Effectiveness of muscle strengthening exercises on knee osteoarthritis

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Patients with knee osteoarthritis (grades I-III in the Kellgren-Lawrence score) Patients aged 40-70 years Patients who had pain, morning stiffness of shorter than 30 minutes, or knee crepitus.

Exclusion criteria:

Concomitant involvement with musculoskeletal diseases other than knee osteoarthritis in one or both knees within the last 6 months A history of knee joint surgery Intra-articular injection of corticosteroids or hyaluronic acid in the knee joints within the past 30 days Non-steroidal anti-inflammatory drugs (NSAIDs) or glucosamine intake within the last 30 days Participation in the muscle-strengthening programs for the knee joint within the last 6 months

Age

From **40 years** old to **70 years** old

Sample size

Target sample size: **96**

Actual sample size reached: **96**

Randomization (investigator's opinion)

Randomized

Randomization description

Random sequence was made by Microsoft Excel using the RAND() function of this software. A 1:1:1:1 allocation was made by an independent investigator using Blocked randomization with randomly varying blocks of 4 and 8 and stratified randomization considering Kellgren-Lawrence grade 1-2 or 3. The allocation sequence was concealed from the investigator enrolling and assessing participants in sequentially numbered, opaque, sealed envelopes.

Blinding (investigator's opinion)

Single blinded

Blinding description

The present study is single-blind. The principal investigator, outcome assessor, and data collector are blinded by not informing them of the group allocation. Data analyst is kept masked by providing a blinded version of data. The care provider and the participants are not blinded. Considering the nature of the intervention, which is an exercise therapy, and the fact that the control group does not receive any intervention, naturally, it is not possible to blind the participants and care providers during the trial.

Placebo

Not used

Assignment

Parallel

Other design features

The participants were asked to regularly perform exercises 5 days a week, for 8 weeks (3 sets/day, 10-15 repetitions). To ensure regular exercising according to the instructions, the participants were provided with written instructions of the exercise programs and a specific form to record their daily exercises during 8 weeks, in addition, they were telephoned once a week by the physiotherapist, encouraging patients to properly adhere to the interventions.

Health conditions studied

1

Description of health condition studied

Osteoarthritis of knee

ICD-10 code

M17

ICD-10 code description

Osteoarthritis of knee

Primary outcomes

1

Description

Score of knee pain on Visual Analogue Scale (VAS) score

Timepoint

At the beginning of the study (before the intervention) and 8 weeks after the initiation of the exercise therapy

Method of measurement

Visual Analogue Scale (VAS)

2

Description

Score of knee physical function on the Western Ontario and McMaster (WOMAC) Index

Timepoint

At the beginning of the study (before the intervention) and 8 weeks after the initiation of the exercise therapy

Method of measurement

Western Ontario and McMaster (WOMAC) Index

3

Description

Score of knee morning stiffness on the Western Ontario and McMaster (WOMAC) Index

Timepoint

At the beginning of the study (before the intervention) and 8 weeks after the initiation of the exercise therapy

Method of measurement

Western Ontario and McMaster (WOMAC) Index

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: received home-based quadriceps strengthening exercises, regularly perform 3 sets of exercises per day, 10-15 repetitions, 5 days a week for 8 weeks.

Category

Rehabilitation

2

Description

Intervention group: received home-based hamstring strengthening exercises, regularly perform 3 sets of exercises per day, 10-15 repetitions, 5 days a week for 8 weeks.

Category

Rehabilitation

3

Description

Intervention group: received home-based strengthening both quadriceps and hamstring muscles groups, regularly perform 3 sets of exercises per day, 10-15 repetitions, 5 days a week for 8 weeks.

Category

Rehabilitation

4

Description

Control group: did not receive the intervention during this period.
