

Clinical Trial Protocol

Iranian Registry of Clinical Trials

24 Jul 2026

The effect of virtual reality-based play therapy on pain intensity and anxiety in patients with open heart surgery

Protocol summary

Study aim

Determining and comparing the average pain score and anxiety of open heart surgery patients before and after the intervention in the intervention and control groups

Design

The clinical trial has a control group, with a parallel group, randomized on 100 patients. Blocking of 4 will be used for randomization.

Settings and conduct

In the open heart special care department, the day after the operation, patients who meet the inclusion criteria will be included in the study. For the intervention group, virtual visualization will be performed with the help of special glasses, while the control group will receive routine care.

Participants/Inclusion and exclusion criteria

Inclusion criteria: full consciousness (relative to place, time and person); RASS +1 to -1; having sinus rhythm during the intervention. Non-entry criteria: receiving anti-anxiety or sedative drugs 24 hours before and after the intervention.

Intervention groups

In the intervention group, a game based on virtual reality will be implemented with the help of glasses for the patients of the intervention group. The control group will receive routine ward care.

Main outcome variables

Pain
