

Clinical Trial Protocol

Iranian Registry of Clinical Trials

19 Jun 2026

The effect of chest physiotherapy on the clinical outcomes of patients with COVID 19

Protocol summary

Study aim

The effect of chest physiotherapy on the clinical outcomes of patients with COVID 19

Design

Clinical trial with control group, with parallel groups, randomized, phase 2 with the help of Med-calc statistical software, with 95% power and 1% error, 52 cases were determined.

Settings and conduct

The current study is a randomized clinical trial that will be conducted on 52 patients with covid-19 admitted to Shahada Izeh Hospital. Due to the necessity of having the entry criteria and also the limited samples, random sampling will be based on the purpose. First, the clinical status of the two groups of patients will be measured by the clinical status survey form, and then the chest physiotherapy program will be tested in the test group. no need for blinding in this trial.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Willingness to participate in the study, moderate severity of the disease, being hospitalized, not suffering from any underlying diseases. The patient's alertness, able to perform chest physiotherapy activities. Exclusion criteria: suffering from respiratory failure and turning the moderate intensity of the disease into its severe type.

Intervention groups

After registering demographic information, patients in the intervention group will undergo chest physiotherapy in addition to routine care. Chest physiotherapy intervention will be done for six days and every morning and evening for 20 minutes. During this period, patients in the control group will receive only routine care related to the care of patients with Covid-19. At the end of the third and sixth days, the patients of both groups will be evaluated.

Main outcome variables

forced expiratory volume in the first second (FEV1);
Forced vital capacity (FVC) and arterial blood test

Scientific title

The effect of chest physiotherapy on the clinical outcomes of patients with COVID 19

Public title

Investigating the effect of chest physiotherapy in the treatment of covid-19

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Desire to participate in the study
The average severity of the disease based on the diagnosis of a doctor specializing in respiratory diseases
Hospitalization at the time of diagnosis
Not using other chest physiotherapy programs at the same time
Absence of underlying diseases such as cancer, cardiovascular diseases and diabetes
Patient alertness
Able to perform chest physiotherapy activities

Exclusion criteria:

Reluctance or refusal to participate in the study
Changing the level of severity of the disease from moderate to severe level of the disease
Having respiratory failure

Age

No age limit

Gender

Both

Phase

No information

Sample size

Target sample size: 52

Randomization (investigator's opinion)

Randomized

Randomization description

For randomization, we use the method of block randomization with blocks with size of 4 and for this purpose, we prepare four sheets of paper. On the two sheets we write the letter I meaning "Intervention" and on the other two sheets we write the letter C meaning "Control". Mix the sheets together and place them in the desk drawer. Upon referral to any of the eligible patients, one of the sheets will be randomly pulled out and based on this sheet being drawn I or C will be assigned to one of the two intervention or comparison groups.

Blinding (investigator's opinion)

Not blinded

Health conditions studied

1

Description of health condition studied

Investigating the effect of chest physiotherapy on the recovery of patients with covid-19

ICD-10 code

U07.1

ICD-10 code description

COVID-19, virus identified

Primary outcomes

1

Description

Vital capacity (FEV2/FVC ratio)

Timepoint

Before starting the intervention and at the end of the sixth day after the start of the intervention (physiotherapy)

Method of measurement

Spirometry device

2

Description

Arterial blood gases include: (PaO2), (PaCO2), (SaO2), (PaO2/FiO2)

Timepoint

Before starting the intervention and at the end of the sixth day after the start of the intervention (physiotherapy)

Method of measurement

Arterial blood test

Secondary outcomes

1

Description

Vital capacity Vital capacity (FEV2/FVC ratio)

Timepoint

At the end of the third and sixth days after the intervention (physiotherapy)

Method of measurement

Spirometry device

2

Description

Arterial blood gases include: (PaO₂), (PaCO₂), (SaO₂), (PaO₂/FiO₂)

Timepoint

At the end of the sixth day after the start of the intervention (physiotherapy)

Method of measurement

Arterial blood test

Intervention groups

1

Description

Intervention group: Patients in the intervention group will undergo chest physiotherapy in addition to routine care related to the care of patients with covid-19. Chest physiotherapy intervention will be done for six days and every morning and evening for 20 minutes.

Physiotherapy of the chest will also be performed by the physiotherapist of the centers every morning and evening. At the end of the third and sixth days, the patients of both groups will be evaluated in terms of FEV1/FVC, FEV1, and FVC parameters using the clinical status survey form.

Category

Treatment - Devices

2

Description

Control group: patients in the control group only receive routine care (depending on the severity of the disease and the underlying diseases of the patient, including oxygen therapy, required supportive treatments, preventive anticoagulation treatment, diagnostic tests, imaging procedures, emphasis on healthy eating and rest sufficient) related to the care of patients with covid-19 will receive. At the end of the third and sixth days, the patients of both groups will be evaluated in terms of FEV1/FVC, FEV1, and FVC parameters using the clinical status survey form.
