Comparison the Effect of Three Different Type of Treatment in Patients Being Treated for Vitiligo Lesions: 1. Microneedling, 2. Microneedling with Topical Fluocinolone and 3. Microneedling with 5-FU

Protocol summary

Study aim

Comparison the Effect of Three Different Type of Treatment in Patients Being Treated for Vitiligo Lesions: 1. Microneedling, 2. Microneedling with Topical Fluocinolone and 3. Microneedling with 5-FU

Design

A prospective, controlled, parallel-group, simple randomization clinical trial of 20 patients with 60 vitiligo lesions

Settings and conduct

This study will be carried out in Imam Khomeini Hospital of Ahvaz affiliated to the Faculty of Medicine of Ahvaz University of Medical Sciences. Demographic characteristics of patients including age, sex, family history of vitiligo, description of previous treatments, duration of disease and lesion location are recorded at the beginning. After that, the studied treatments are performed on the patient every week and the results of the previous procedures are also recorded. This work will continue for three months. After completing the study, the patients will be monitored for six months and the amount of changes in the lesion will be recorded.

Participants/Inclusion and exclusion criteria

Patients with stable vitiligo and no new lesions in the previous six months Except: pregnant Lactation Age under ten years Facial lesions, genitalia and wrinkled areas Active Kubner phenomenon Having coagulation diseases Patients with active infection Patient with high risk of keloid and previous history of keloid Presence of sensitivity to the study drugs

Intervention groups

Three patches are selected for each patient. A patch for combination of microneedling and fluocinolone is applied as a control, second patch for combination of microneedling and local fluorouracil, and third patch for microneedling alone

Main outcome variables

G-Score; Age; Gender; Skin type; Family history; Previous treatments; duration of lesions; Repigmentation start date

Comparison the Effect of Three Different Type of Treatment in Patients Being Treated for Vitiligo Lesions: 1. Microneedling, 2. Microneedling with Topical Fluocinolone and 3. Microneedling with 5-FU

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

All patients with stable vitiligo without new lesions in the previous six months who have read and signed the consent form

Exclusion criteria:

Pregnant Women Lactating Mothers Facial lesions, genitalia and wrinkled areas Active koebner phenomenon Having coagulation diseases Patients with active infection Patient with high risk of keloid and previous history of keloid Presence of sensitivity to the study drugs

Age

From **10 years** old

Gender

Both

Phase

Health conditions studied**1****Description of health condition studied**

Vitiligo

ICD-10 code

L80

ICD-10 code description

Vitiligo

Primary outcomes**1****Description**

Vitiligo lesions repigmentation

Timepoint

At the beginning of the study; After starting the study every week for three months; Three and six months after completing the study

Method of measurement

The amount of change in the area of the lesion after treatment by examining the photos in color analysis software

Secondary outcomes**1****Description**

G-score

Timepoint

After the beginning of repigmentation every week, every month after the end of the study for up to six months

Method of measurement

Color analysis software

2**Description**

Repigmentation start time
Timepoint
After starting to study, every week
Method of measurement
Observing the color change through photo analysis

Intervention groups

1

Description

Control group: The combination of microneedling and fluocinolone; In this group, dermapen cartridge 36 (Dr.Pen brand) microneedling with a thickness of 1.5 mm is performed once a week until Pinpoint Bleeding occurs, and after that the patient uses fluocinolone 0.025% cream twice a day.

Category

Treatment - Drugs

2

Description

Intervention group: Microneedling; In this group, microneedling is performed only once a week. Before performing the process of all three patches, the lesion site is numbed for 20 minutes after sterilizing with 70% alcohol using lidocaine cream.

Category

Treatment - Other

3

Description

Intervention group: Combination of microneedling and topical fluorouracil; In this group, microneedling is performed once a week, and immediately after microneedling, 5% FU cream is applied on the surface of the lesion as a thick layer, then the lesion is covered with a closed dressing for 24 hours. After opening the dressing, the desired area is washed and cleaned. Also, the patient uses 5-FU cream topically on the lesion once a day. The duration of treatment for each person is three months, during which the patient undergoes microneedling 12 times with 5-FU cream.
