Efficacy of connective tissue graft as a membrane and ABBM With and without PRP in treatment of intrabony defects

Protocol summary

Summary

Aims: The aim of this study is to clinically evaluate the efficacy of ABBM and GTR by the means of connective tissue as a membrane (CTG) with and without PRP in treatment of intrabony defects. Materials and methods : In this double-blind randomized clinical trial 15 pair of intrabony defects in 15 patients with chronic periodontal disease were randomly treated with a combination of either PRP+ABBM+CTG or ABBM+CTG. The following clinical parameters were evaluated at baseline and at 6 months Re-entry with using a stent as reference point: probing pocket depth (PPD), clinical attachment level (PAL-S), free gingival margin position (FGM-S), crestal position(CREST-S),Crest to defect depth and defect depth to stent.

Scientific title

Efficacy of connective tissue graft as a membrane and ABBM With and without PRP in treatment of intrabony defects

Public title

Efficacy of connective tissue graft as a membrane and ABBM With and without PRP in treatment of intrabony defects

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: No amount of 25% or less plaque before surgery . Teeth with a mobility of less than 3 Miller . Endodontic treatment of teeth or vital teeth. . Patients with moderate to advanced chronic periodontitis and at least one pair of radiographic lesions in non-adjacent teeth, and vertically between the minimum level of attachment to the CEJ from the first phase of treatment is 5 mm. The depth of the defect during surgery is at least 3 mm. The vertical wall is 2 or 3 bone lesions. Exclusion criteria: 1. Systemic diseases 2. Pregnancy and breast feeding 3. The systemic use of

antibiotics in the past three months 4. Abnormal platelet count before surgery in a month 5. Furcation involvement and grade 3 or 4 6. Other forms of chronic periodontitis periodontitis to 7. History of periodontal surgery in 6 Months
