The effect of fluconazole lozenge on oral candidiasis in immunocompromised patients: an experimental study and a randomized clinical trial

Protocol summary

Study aim

Evaluation of the clinical effectiveness of fluconazole lozenges in the treatment of oral candidiasis

Design

In this study, the phase 3 clinical trial is conducted on 50 patients, the patients are randomly divided into two groups of fluconazole and control (25 people in each group). The placement of patients in these two groups is simple and based on the RAND function of Excel software. This study is double-blind, and the doctor and the patient do not know which group they are in

Settings and conduct

A double-blind randomized controlled clinical trial related to oral candidiasis in patients admitted to Shahid Sadoughi Hospital in Yazd is conducted on 50 patients in two control and intervention groups. The physician and the statistical analyst do not know the type of intervention of the studied groups

Participants/Inclusion and exclusion criteria

Inclusion criteria: Age 18 to 70 years Women are not pregnant or lactating No history of fluconazole allergy
Exclusion criteria: occurrence of allergic reaction to fluconazole exacerbation of the disease

Intervention groups

In the current study, patients will be divided into two groups: the group receiving fluconazole lozenges, the group receiving standard treatment.

Main outcome variables

Cotton feeling in the mouth, loss of taste, total area of oral candidiasis lesions

Scientific title

The effect of fluconazole lozenge on oral candidiasis in immunocompromised patients: an experimental study and a randomized clinical trial

Public title

The effect of fluconazole lozenge on oral candidiasis

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

The patient is undergoing cancer chemotherapy in Yazd hospitals. The woman should not be pregnant or lactating. Willingness to participate in the study and complete the informed consent form Age 18 to 70 years

Exclusion criteria:

The occurrence of an allergic reaction to fluconazole Aggravation of the disease and the need for drug intervention to control the disease Non-cooperation in the use of medication

Age

From **18 years** old to **70 years** old

Gender

Both

Phase

3

Groups that have been masked

- Participant
- Care provider
- Data analyser

Sample size

Target sample size: **50**

Randomization (investigator's opinion)

Randomized

Randomization description

Patients who meet the inclusion criteria receive one of the drugs labeled A or B by a simple randomization method based on the random number function (RAND), of Excel software. Intervention with each of these drugs four times a day and It is done for 7 days. On the 1st, 3rd, 7th, and 14th days from the beginning of the intervention, cotton sensation in the mouth, loss of taste, and pain during eating and swallowing are checked.

Blinding (investigator's opinion)

Triple blinded

Blinding description

Both placebo lozenges and placebo drops are prepared and placed next to lozenges containing fluconazole and nystatin drops in coded uniform containers. Patients of both study groups receive both lozenges and drops, one of which contains medicine and the other placebo. The prescribing physician, the patient, and the data analyzer are not aware of their content.

Health conditions studied

1

Description of health condition studied

Oral candidiasis

ICD-10 code

B37.0

ICD-10 code description

Candidal stomatitis

Primary outcomes

1

Description

Total area of oral candidiasis lesions

Timepoint

At the beginning of the treatment and after every 2 days until 10 days, the condition of oral candidiasis lesions is evaluated in terms of the total area of the lesions.

Method of measurement

Determining the total area of oral candidiasis lesions through Fiji software

Secondary outcomes

1

Description

Cotton feeling in the mouth

Timepoint

the beginning of the treatment and after every 2 days up to 10 days, the condition of oral candidiasis lesions is evaluated in terms of the feeling of cotton in the mouth (score 0 to 4).

Method of measurement

Scoring the feeling of cotton in the mouth using a questionnaire

2

Description

Decreased taste

Timepoint

At the beginning of treatment and after every 2 days until 10 days, the condition of oral candidiasis lesions is evaluated in terms of taste loss (score 0 to 4).

Method of measurement

Scoring of taste reduction using a questionnaire

Intervention groups

1

Description

Intervention group: Including 25 patients hospitalized in Yazd hospitals and undergoing cancer chemotherapy, who were diagnosed with oral candidiasis and met the inclusion criteria, and were randomly selected based on the RND function of Excel software. Patients in the fluconazole group use lozenges containing 20 mg of fluconazole orally 4 times a day on days 1 to 10. In this research, fluconazole lozenges are prepared using fluconazole powder purchased from Amin Pharmaceutical Company, which has a license from the Food and Drug Organization of Iran. At the beginning of the treatment and after every 2 days until 10 days, the condition of oral candidiasis lesions in terms of the total area of the lesions (score 0 to 4), intervention of cotton sensation in the mouth (score 0 to 4), loss of taste, (score 0 to 4) and the number of lesions are evaluated.

2

Description

Control group: Including 25 patients hospitalized in Yazd hospitals and undergoing cancer chemotherapy, who were diagnosed with oral candidiasis and met the inclusion criteria, and were randomly selected based on the RND function of Excel software. Nystatin group patients use 20 drops of nystatin orally 4 times a day on days 1 to 10. In this study, Nystatin drops are obtained from Emad Pharmaceutical Company, which has a license from the Food and Drug Organization of Iran. At the beginning of the treatment and after every 2 days until 10 days, the condition of oral candidiasis lesions in terms of the total area of the lesions (score 0 to 4), intervention of cotton sensation in the mouth (score 0 to 4), loss of taste, (score 0 to 4) and the number of lesions are evaluated.
