

Clinical Trial Protocol

Iranian Registry of Clinical Trials

17 Jun 2026

Comparative effects of nerve mobilization and active release technique on pain range of motion and disability in carpal tunnel syndrome patients among pregnant women.

Protocol summary

Study aim

To study the comparative effects of active release technique and nerve mobilization technique on the pain, range of motion and disability in carpal tunnel syndrome patient among pregnant women

Design

Study design will be randomized clinical trial.

Settings and conduct

The study will be held at Arif memorial hospital, Lahore.

Participants/Inclusion and exclusion criteria

Pregnant females with age between 20-40 years and having numbness in hands will included in the study. while non pregnant diabetic patients or patients suffering from hypothyroidism, rheumatoid arthritis, osteoarthritis and sarcoidosis will exclude from our research.

Intervention groups

Participants will be divided in two treatment groups. Both groups will be assessed before (pre) and after (post) the treatment. Group A patients will be treated with the active release technique and conventional physical therapy treatment. Group b patient will be treated with nerve mobilization technique and conventional physical therapy treatment.

Main outcome variables

Boston questionnaire will used to assess the symptom severity and functional status in carpal tunnel syndrome patients. NPRS will be used to assess pain severity. Goniometer will be used for wrist range of motion.

Scientific title

Comparative effects of nerve mobilization and active release technique on pain range of motion and disability in carpal tunnel syndrome patients among pregnant women.

Public title

Effects of nerve mobilization and active release

technique in treatment of carpal tunnel syndrome

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Age between 20-40 years. Pregnant women with numbness in hands Subjects with diagnosed carpal tunnel syndrome and related symptoms that scored 3 or worse on the symptom severity and functional status questionnaire

Exclusion criteria:

If subjects have a history of causes of carpal tunnel syndrome e.g. diabetes mellitus, rheumatoid arthritis, chronic renal failure treated by hemodialysis, sarcoidosis. If subjects have already been treated with wrist splint or have previous carpal tunnel release surgery

Age

From **20 years** old to **40 years** old

Gender

Female

Phase

N/A

Groups that have been masked

- Outcome assessor

Sample size

Target sample size: **34**

Randomization (investigator's opinion)

Randomized

Randomization description

The sample size of study is 34. Participants will allocate in two treatment groups by simple random sampling using lottery method. We will make 100 chits, each with the name of a participant written on it. The chits are placed in a container of some kind, give a good shake, and 30 chits will be picked. Those whose names on the chits will be selected for the respective treatment.

Blinding (investigator's opinion)

Single blinded

Blinding description

The outcome assessor will not know which participant will be allocated in group A or group B. So the study will be single blinded.

Description of health condition studied

carpal tunnel syndrome

ICD-10 code

G56.0

ICD-10 code description

Carpal tunnel syndrome

Primary outcomes

1

Description

symptom severity and functional status

Timepoint

Before intervention and 4 weeks after intervention

Method of measurement

Boston Carpal Tunnel Score questionnaire

2

Description

Pain

Timepoint

Before intervention and 4 weeks after intervention

Method of measurement

Numeric pain rating scale will be used to measure pain intensity

3

Description

Range of motion

Timepoint

Before treatment and 4 weeks after treatment

Method of measurement

Goniometer

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: nerve mobilization technique group,

group A will consist of 17 patients which will randomly allocate. Patients will treat with median nerve mobilization and heating pad. The patient will be in sitting position, therapist standing by side of patient to straighten the arm extend the wrist and apply passive pressure on the fingers. Repeat this procedure three times a day (3 sets 10 rep) and two times per week for four weeks. Assessment of patient's symptom will take before and after treatment.

Category

Treatment - Other

2

Description

Intervention group: active release technique group, group B will also be included 17 patients. Patients will treated with active release technique and heating pad. The patient may sit or lie supine and therapist stand in front or the patient or at the side respectively. The therapist thumb is placed on the medial and lateral attachment of the transverse carpal ligament. As the therapist fingers wrap around the dorsal surface of the wrist. The therapist exert the tension on the carpal region (especially the flexor retinaculum) by pressing the thumb into the volar surface of the base of the thumb and pushing the thumb apart. This position is held for 20-60 sec and then release. 3 set with 5 to 6 repetition will be performed, two times per week. The treatment will be given for 4 week. Assessment of patient's symptom will take before and after treatment.
