Effect of Therapeutic Ultrasound versus Muscle Energy Techniques of piriformis and iliopsoas for coccydynia in pregnant females

Protocol summary

Study aim

To compare the effects of therapeutic ultrasound and muscle energy techniques of piriformis and iliopsoas for coccydynia in pregnant females

Design

The study is a concealed, randomized, blinded, clinical trial with a parallel group design. Randomization is done by lottery method. In this method, the researcher gives each participant of the trial a number. Researchers draw numbers from the box randomly to allocate participants in two groups.

Settings and conduct

This study is conducted at Arif Memorial Hospital. In this trial participants are blinded through concealment to avoid biasness.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Age 20-40 years pregnant females
Idiopathic coccydynia
Subjects willing to undergo muscle energy techniques of piriformis and iliopsoas
Exclusion criteria: Tumors
Trauma
Subjects with history of spinal surgery

Intervention groups

The individuals are grouped in 2 categories; Group A will receive Therapeutic ultrasound. Group B will receive muscle energy techniques of piriformis and iliopsoas

Main outcome variables

Pain is measured before the application of techniques using Numeric Pain Rating Scale (NPRS).

Sample size

Target sample size: **26**

Randomization (investigator's opinion)

Randomized

Randomization description

Patients were allocated into two groups i.e.; Group A and Group B, by lottery method. Lottery method is a type of simple random sampling. In this method, each participant of the trial is assigned a unique number. In the next step these numbers are written on separate cards which are physically similar in shape, size, color etc. 35 cards were used. Then they are placed in a basket and thoroughly mixed. In the last step the slips are taken out randomly without looking at them and are placed into two sets randomly. Total of 26 cards were taken out, 13 participants in each group.

Blinding (investigator's opinion)

Single blinded

Blinding description

The blinding is achieved by concealment in which the treatment allocation for each patient is not revealed to the patient. This is done to avoid biasness.

Sacrococcygeal disorders, not elsewhere classified

Primary outcomes

1

Description

Pain

Timepoint

Pre and Post 1 Month

Method of measurement

Pain is measured before the application of techniques using Numeric Pain Rating Scale (NPRS).

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: Group A will receive Therapeutic ultrasound. Therapeutic ultrasound is used with the intensity of 1.5W/cm² for 3-5 min with the use of ultrasonic gel and this procedure is done by approaching the patient posteriorly using irregular probe.

Category

Treatment - Other

2

Description

Intervention group: Group B will receive muscle energy techniques of piriformis and iliopsoas. For piriformis MET, ask patient to Lay the patient in the supine position and bend the knee of affected side and place the foot of that side on the lateral aspect of the opposite knee. The therapist was at the side of the patient. The therapist will push the knee medially until meeting the restrictive barrier. Ask the patient push against the therapist's resistance for 3 to 5 sec, allow for a period of isometric relaxation, then engage a new barrier and repeat three times. Then, return the patient to a neutral position. For Iliopsoas MET, Patient position is Supine lying with lower

leg hanging off the end of the plinth. The patient flexes the contralateral hip and knee to hug the lower extremity to the chest. Therapist position is Standing on the ipsilateral side of the dysfunction. By Using one hand to keep the contralateral leg flexed, the other hand will provide a downward force immediately proximal to knee until reaching the restrictive barrier. Continue to engage the restrictive barrier and instruct the patient to bring the knee up toward the ceiling to achieve hip flexion for 3 to 5 sec. Instruct the patient to relax and move the hip further into extension by providing a downward force proximal to the knee. Repeat the last two steps 3 to 5 times. After last repetition passively return the patient's leg to a neutral position.
