comparson of the effect of Chlorhexidine mouthwash and sodium fluoride mouthwash on gingival healing around stainless steel crown in primary teeth

Protocol summary

Study aim

Comparison of the effect of chlorhexidine mouthwash and sodium fluoride mouthwash on gum health after stainless steel crowns in primary teeth.

Design

Clinical trial with a control group, with parallel groups, double-blind, randomized, phase 3 on 30 patients.

Settings and conduct

The study is conducted in the children's department of the dental clinic of Ilam University of Medical Sciences on children aged 6 to 12 years. 30 patients are divided into two equal groups. The amount of plaque index and gingival index around the decayed tooth is measured. chlorhexidine and sodium fluoride mouthwashes are applied twice a day for a week with an ear cleaner around the ssc cover done at the college. At the end, plaque index and gingival index are calculated.

Participants/Inclusion and exclusion criteria

log in : Children 6 to 12 years old At least 1 primery tooth needs ssc coating Failure to enter: Systemic disease Dental crowding

Intervention groups

Case group: sodium fluoride mouthwash is used on the gums around the ssc Control group: Chlorhexidine mouthwash is used on the gums around the ssc

Main outcome variables

Determination of plaque index and gingival index in the group treated with chlorhexidine mouthwash
Determining plaque index and gingival index in the group treated with sodium fluoride mouthwash

Public title

comparison of the effect of Chlorhexidine mouthwash and sodium fluoride mouthwash on gingival healing around stainless steel crown in primary teeth

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

6 to 12 year old child Having at least 1 posterior primary tooth that requires a stainless steel crown

Exclusion criteria:

Child with systemic disease Child with dental crowding

Age

From **6 years** old to **12 years** old

Gender

Both

Phase

3

Groups that have been masked

- Participant
- Outcome assessor

Sample size

Target sample size: **30**

Randomization (investigator's opinion)

Not randomized

Randomization description

Blinding (investigator's opinion)

Double blinded

Blinding description

Patient : the patient does not know the type of mouthwash. After obtaining the consent form from the patient, the relevant mouthwash is poured into special containers that have been prepared in advance and the type of mouthwash inside is not known and is delivered to the patient for use. Outcome assessor :the type of mouthwash is not mentioned in the evaluation form and only the patient's code is written. In a separate list, in front of each patient's name, the relevant code and the name of the mouthwash are written so that the analyzer can use that list to perform the analysis. In this way, the evaluator does not know the name of the patient and the type of mouthwash.
