Assessing the effectiveness of the educational program based on the theory of planned behavior on donating breast milk to the milk bank in breastfeeding mothers

Protocol summary

Study aim

Determining the effectiveness of the educational program based on the theory of planned behavior on donating breast milk to the milk bank in nursing mothers

Design

A quasi-experimental study with an intervention group and a control group, not being randomized and not being blinded, on 66 breastfeeding mothers

Settings and conduct

Among all health centers affiliated to Tehran university of medical sciences Two centers that nursing mothers visit the most and have the equipment to hold in-person classes will be selected. Then we randomly chose one center for collecting intervention (33 people) and one center for control group (33 people). Nursing mothers who meet the study entry criteria and have expressed their consent will be selected by convenience sampling.

Participants/Inclusion and exclusion criteria

Mother's willingness to participate in the study; Being a resident of Tehran; Breastfeeding now; Having an infant under one year old; mother has sufficient breast milk for her own baby with the approval of a doctor or midwife; Not taking drugs or, smoking and not being addicted; Mother has no psychological or medical problem; Infant has no psychological or medical problem

Intervention groups

Intervention group will start receiving 60-minute weekly educational program based on TPB components preferably face-to-face for 4 weeks at the health center. Control group will receive only routine care and they will not receive any intervention.

Main outcome variables

knowledge, attitude, subjective norms, perceived behavioral control, behavioral intention and milk donation behavior

Health conditions studied**1****Description of health condition studied**

Breast milk donation

ICD-10 code**ICD-10 code description****Primary outcomes****1****Description**

The number of mothers who has donated their breast milk

Timepoint

Before, immediately and 3 months after intervention

Method of measurement

The researcher made questionnaire that includes 7 sections. The first part is to check the demographic information including age, education, number of pregnancies, delivery method, gender of the current child, etc. The second part includes questions related to knowledge with a four-option scale. The third part includes questions related to attitude with a five-point Likert scale, the fourth part includes questions related to subjective norms with a five-point Likert scale, the fifth part includes questions related to perceived behavioral control with a five-point Likert scale, the sixth part includes questions related to Behavioral intention with a five-point Likert scale and the seventh part of the questions related to the behavior of breast milk donation.

Secondary outcomes

empty

Intervention groups**1****Description**

Intervention group: The intervention group will consist of 33 nursing mothers referring to the intervention health center, who will be selected by convenience sampling method. For the mothers of the intervention group, 4 weekly 60-minute training sessions will be held based on components of theory of planned behavior in person at the health center and if it is not possible, it would be held virtually. In order to prevent the loss of samples and increase the flexibility of the face-to-face training

program for mothers, the number of training courses will be planned as 3 courses of 11 people, and the duration of each course will be 4 weeks considering the weekly sessions.
