Outcome of external Dacryocystorhinostomy without intubation versus monocalicular intubation in patient with primary acquired nasolacrimal duct obstruction

Protocol summary

Summary

Patients complaining of lacrimation and other signs and symptoms of nasolacrimal duct obstruction, referred to Nikookari hospital (Tabriz, Iran), will undergo clinical examination, probing and irrigation of nasolacrimal duct. Patients with a history of surgery on nasolacrimal ducts or with a diagnosis of secondary obstruction of nasolacrimal ducts will be excluded from the study. Forty-six patients will be chosen and randomly divided in two groups of A and B; each composed of 23 individuals. In group A intervention includes external dacteriucytrinstomy with intubation monocalicular (silicon tube) and in group B intervention includes external dacteriucytrinstomy without intubation . After six weeks silicon tube will be removed and patients will be followed for three month. The success rate of interventions will be evaluated by MUNK scoring system.
