Effectiveness of unified protocol of transdiagnostic treatment on psychological symptoms, fatigue, emotion regulation, health anxiety, sleep quality, and sexual satisfaction in patients with multiple sclerosis

Protocol summary

Study aim

Present study aims to investigate the effectiveness of unified protocol of transdiagnostic treatment (UP) on psychological symptoms, fatigue, emotion regulation, health anxiety, sleep quality, and sexual satisfaction in patients with multiple sclerosis (MS).

Design

This randomized and single-blind clinical trial with parallel and control groups will be conducted on 48 patients who will be randomly selected using the simple random.

Settings and conduct

Patients referring to Moheb Mehr Hospital Neurology Clinic, Tehran, Iran are chosen as the participants of the study. In this single-blind study, sealed opaque envelopes will be used to conceal the sequencing. Intervention group will receive 12 sessions of online psychotherapy based on unified protocol of transdiagnostic treatment and control group will not receive the treatment intervention. The responsible for data collection is blind to group allocation and the type of intervention.

Participants/Inclusion and exclusion criteria

Statistical society of the study includes all of the MS patients in Tehran, and selected sample will be 48 patients referred to neurology clinic of Moheb Mehr Hospital. Main inclusion criteria include confirmation of diagnosis of MS, being at least 20 y/o, being sexually active, fixed dosage of medicine since 3 month before the beginning of treatment, and not having severe psychiatric and physical illnesses.

Intervention groups

Intervention group will receive 12 sessions of online psychotherapy based on unified protocol of transdiagnostic treatment and control group will not receive the treatment intervention.

Main outcome variables

Improving psychological symptoms (depression, anxiety, stress), fatigue, emotion regulation, health anxiety, sleep quality, and sexual satisfaction in MS patients.

Scientific title
Effectiveness of unified protocol of transdiagnostic treatment on psychological symptoms, fatigue, emotion regulation, health anxiety, sleep quality, and sexual satisfaction in patients with multiple sclerosis

Public title
Effectiveness of transdiagnostic treatment on psychological parameters in multiple sclerosis
Purpose
Treatment
Inclusion/Exclusion criteria
Inclusion criteria:
Confirmation of relapsing-remitting multiple sclerosis diagnosis by neurologist Age least 20 years Being sexually active Mastery in Persian language and reading and writing literacy Fixed dosage of medicine from 3 months before beginning the treatment Being physically able to participate in weekly sessions Not being diagnosed with severe psychiatric disorders Not being diagnosed with another serious or chronic physical illness Not having the history of receiving psychological treatments
Exclusion criteria:
Age
From **20 years** old
Gender
Both

Phase
2-3
Groups that have been masked

- Participant

Sample size
Target sample size: **48**
Randomization (investigator's opinion)
Randomized
Randomization description
The process of random allocation of study participants to two groups; intervention group and control group included both creating a random sequence and concealing the random allocation. Firstly, using the random sequence rule, 48 papers for participants of the intervention and control groups (which are marked with A and B and are not defined to avoid bias) were thrown into a lottery container and then the papers were removed from the lottery container -without replacement- and the created sequence is recorded Then, using the snooze method, 48 envelopes were prepared and each of the random sequences created is recorded on a card and placed in the envelopes in order, and the envelopes were also numbered. Then, the envelopes were given to the participants based on the order of entering the study, so the grouping of each was determined.
Blinding (investigator's opinion)
Single blinded
Blinding description
Patients referring to Moheb Mehr Hospital Neurology Clinic, Tehran, Iran are chosen as the participants of the study. In this single-blind study, sealed opaque envelopes will be used to conceal the sequencing. Intervention group will receive 12 sessions of online psychotherapy based on unified protocol of transdiagnostic treatment and control group will not receive the treatment intervention. The responsible for data collection is blind to group allocation and the type of intervention.
