Comparing radial artery flow-mediated dilation in transient ulnar and brachial artery compression

Protocol summary

Study aim

The purpose of this study is to comparing flow mediated dilation (FMD) through two methods of compression of the brachial and ulnar artery.

Design

The clinical trial was conducted on two randomized cross-over and double-blind groups on 30 volunteers .

Settings and conduct

30 volunteers referred to the catheterization department of Imam Khomeini Hospital were studied. After 15 minutes of rest, the baseline diameter of the radial artery was measured. In the first group the ulnar artery was compressed for 5 minutes, and the two-dimensional images of radial artery were recorded after the compression was released, every 30 seconds to 2 minutes. In the second group, a cuff was fixed in the upper arm area and 30 mmHg Above systolic pressure was inflated for 5 minutes and then two-dimensional images were recorded at the mentioned time intervals. Then, in each group, another maneuver was performed in the evening of the same day .

Participants/Inclusion and exclusion criteria

Participants with history of angiography through the radial artery, and a history of taking vasoactive drugs or congenital heart disease will be excluded from the study.

Intervention groups

First group: ulnar compression will be done at 8-10 in the morning and Upper arm compression will be done at 4-6 in the evening. The second group: Upper arm compression will be done at 8-10 in the morning and ulnar compression will be done at 4-6 in the evening.

Main outcome variables

The effect of the studied maneuvers on the diameter and area of the radial artery

Scientific title

Comparing radial artery flow-mediated dilation in transient ulnar and brachial artery compression

Public title

Comparing radial artery flow-mediated dilation in transient ulnar and brachial artery compression

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Participants over the age of 18 years old should not have a history of angiography through the radial artery.

Participants over the age of 18 years old should not have a history of use of vasoactive drugs include

1) Catecholamines: adrenaline, noradrenaline, dopamine, dobutamine, ... 2) vasodilators: nitrates, ...

3) Vasopressors: phenylephrine

, vasopressin, ... 4) Phosphodiesterase inhibitors 5) Calcium Sensitizers and digoxin, calcium. Participants over the age of 18 years old should not have a history of congenital heart disease.

Exclusion criteria:

The participant's request to exit from the study before the completion of study. The need to take vasoactive drugs during the study according to therapeutic indications

Age

From **18 years** old

Gender

Both

Randomization (investigator's opinion)

Randomized

Randomization description

Blocks were used for randomization and the participants were divided into 6 blocks of 5 participants. 3 blocks were assigned to group 1; another 3 blocks assigned to group 2.

Blinding (investigator's opinion)

Double blinded

Blinding description

Before starting the study, the participant does not know which group he is in. The first group measured the diameter of the radial artery by closing the cuff on the brachial area in the morning and pressing on the ulnar area in the afternoon. The second group measured the diameter of the radial artery by pressing on the ulnar area in the morning and closing the cuff in the brachial area in the afternoon. The radiologist who measures the diameter and area of the radial artery before and after the maneuver does not know the type of maneuver and the time of the study.
