Comparative Evaluation of the effect of tranexamic acid impregnated gauze with gelatamp in controlling bleeding after the extraction of four maxillary primary incisors in children candidates for dental treatment under general anesthesia

Protocol summary

Study aim

Comparative Evaluation of the effect of tranexamic acid impregnated gauze with gelatamp in bleeding control

Design

Randomized cross over trial on 30 patient, double-blind, This study will be conducted in a double-blind manner so that the examining clinician and data analyst will not know the type of intervention.

Settings and conduct

Children candidates for dental treatment under general anesthesia who refer to the hospital dental department of Isfahan Faculty of Dentistry during the study, if they are eligible, will be included in the study and will be randomly divided with the help of a random number table.

Participants/Inclusion and exclusion criteria

Inclusion Criteria: The need to Extract Primary incisors, Age 2 to 4 years, The Studied Teeth should have less than One-third root resorption and unmaintainable crowns, The Child under Study only needs to have four Primary incisors Extracted and no other teeth should be Extracted from the Patient If the Tooth is not infected and the root has not Decayed to a large extent, it is included in the study Exclusion Criteria: History of any uncontrolled systemic disease, Patients whose parents do not consent to participate in the study for any reason

Intervention groups

Intervention group 1: Gelatamp, two pieces of gelatamp (Spongostan, Ferrosan, Denmark) will be placed half inside the socket. Intervention group 2: Tranexamic acid-impregnated gauze, 2x2 gauze impregnated with 4cc of Tranexamic acid ampoule (Tranexip, Caspian Tamin, Iran) with a dose of 500 mg/5 ml will be applied to two adjacent teeth.

Main outcome variables

Intensity of Bleeding, Bleeding Time

Scientific title

Comparative Evaluation of the effect of tranexamic acid impregnated gauze with gelatamp in controlling bleeding after the extraction of four maxillary primary incisors in children candidates for dental treatment under general anesthesia

Public title

Comparative Evaluation of the effect of tranexamic acid impregnated gauze with gelatamp in controlling bleeding

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

The need to Extract Primary incisors Age 2 to 4 years
Children are not affected to Congenital Hemorrhagic Diseases
Children should not receive Anticoagulants
The Child does not have a Mental or Physical Disability
The Studied Teeth should have less than One-third root Resorption and unmaintainable Crowns
Do not take Ibuprofen and Aspirin Painkillers before and after work
The Child does not have Contraindications for General Anesthesia
The Studied Child only needs to have four Primary incisors Extracted and another Tooth Extracted from the Patient
If the Tooth is not Infected and the root has not Decayed to a large extent, it is included in the Study
If They do not have Complications during General Anesthesia. (Hypoxia, Blood Pressure drop, Larynx Spasm, etc.)

Exclusion criteria:

History of any uncontrolled systemic disease
Patients whose parents do not consent to participate in the study for any reason

Age

From **2 years** old to **4 years** old

Gender

Both

Phase

3

Sample size

Target sample size: **30**

Randomization (investigator's opinion)

Randomized

Randomization description

Children who are candidates for extraction of primary teeth who refer to the hospital dental department of Isfahan Faculty of Dentistry during the study, if they are eligible, will be included in the study and will be randomly assigned by simple randomization method and individually with the help of a table of random numbers; In this method, the 'AB' order is considered for each odd number, and the 'BA' order is considered for each even number. Then a column is randomly selected from the table and if the first selected number is odd, the 'AB' order is applied which means the first patient is allocated

in the A group and receives GELATAMP treatment, and as a result, the next patient is allocated to the B group and receives TRANEXAMIC ACID IMPREGNATED GAUZE treatment. Similarly, If the selected number is even, the 'BA' order is applied and the first patient is allocated in the B group and receives TRANEXAMIC ACID IMPREGNATED GAUZE treatment, and as a result, the next patient is allocated to the A group and receives GELATAMP treatment. This is repeated 15 times until you get 15 samples in each group.

Blinding (investigator's opinion)

Double blinded

Blinding description

Outcome assessor was not aware of the type of material used for each tooth while evaluating the treated teeth clinically and radiographically. This study will be conducted in a double-blind manner so that the examining clinician and data analyst will not know the type of intervention.

Health conditions studied

1

Description of health condition studied

Tranexamic Acid, Controlling Bleeding, Gelatamp

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

Intensity of Bleeding

Timepoint

The determined time intervals are 10, 5, and 15 minutes after starting to use Gelatamp and gauze impregnated with Tranexamic acid

Method of measurement

Fanning scale

2

Description

Bleeding Time

Timepoint

The determined time intervals are 10, 5, and 15 minutes after starting to use Gelatamp and gauze impregnated with Tranexamic acid

Method of measurement

Fanning scale

Secondary outcomes

1

Description

Oral Health

Timepoint

At the beginning of the study (before the start of the intervention) and Two weeks after the end of the intervention

Method of measurement

Examination of the child's mouth

Intervention groups

1

Description

The first intervention group: Gelatamp, after extraction for two teeth, two pieces of Gelatamp (Spongostan, Ferrosan, Denmark) will be placed half inside the socket and after a period of 4 weeks in the second phase of the study, the groups will be changed.

Category

Treatment - Other

2

Description

The second intervention group: Tranexamic acid impregnated gauze, a gauze with dimensions of 2 x 2, impregnated with 4cc of ampoule of tranexamic acid (Tranexip, Caspian Tamin, Iran) with a dose of 500 mg/5 ml will be applied to two similar teeth and after a period of 4 weeks in the second phase of the study, the groups will be changed.
