Investigating the effect of cyproheptadine on appetite ,laboratory and enteropometric indices in chronic renal failure pateint on hemodialysis

Protocol summary

Study aim

Determining the effect of cyproheptadine drug on appetite, laboratory and anthropometric indicators of chronic kidney patients undergoing hemodialysis

Design

Clinical trial with control group with parallel groups, double-blind, randomized, phase 3 on 124 patients. Available sampling was used for randomization.

Settings and conduct

124 patients from 18 to 80 years of age referring to the hemodialysis department of Shahid Jalil Yasouj Hospital are eligible for selection and after obtaining informed consent, they are randomly assigned to two intervention and control groups. For the intervention group, in addition to routine treatment, cyproheptadine tablets will be administered at a dose of 4 mg daily and the placebo for control group. After three months, laboratory and anthropometric parameters and appetite of the patients will be measured.

Participants/Inclusion and exclusion criteria

log : Chronic kidney patients undergoing hemodialysis, 18 to 80 years old Patients who undergo dialysis twice a week with good efficacy. Willingness of people to participate in the plan Absence of accompanying disease that causes the patient's anorexia. Not taking drugs that increase appetite. Exit: Migration or death of the patient Dissatisfaction with the continuation of treatment In case of other infectious or chronic diseases during the research period Patients who have undergone organ transplant surgery.

Intervention groups

In addition to routine treatment, intervention group patients will be prescribed cyproheptadine 4 mg daily, and placebo for control group will be prescribed. After three months, the laboratory and anthropometric indicators and appetite of the patients will be measured again

Main outcome variables

Improving the physiological conditions and increasing the

quality of life of patients undergoing hemodialysis

Scientific title	Investigating the effect of cyproheptadine on appetite ,laboratory and enteropometric indices in chronic renal failure pateint on hemodialysis
Public title	Investigating the effect of cyproheptadine in chronic kidney patients
Purpose	Supportive
Inclusion/Exclusion criteria	
Inclusion criteria:	Chronic kidney patients undergoing dialysis between 18 and 80 years of age, at least three months have passed since the start of dialysis. Patients who undergo dialysis twice a week with good efficacy. People's willingness to participate in the project. Absence of accompanying disease (infection, uncompensated heart failure, malignancy, liver cirrhosis, covid-19) that causes the patient's anorexia. Not taking drugs such as tricyclic antidepressants and corticosteroids that increase appetite.
Exclusion criteria:	Patient migration or death Dissatisfaction with the continuation of treatment by the patient. If other infectious or chronic diseases occur during the research period. Patients who underwent organ transplant surgery.
Age	From 18 years old to 80 years old
Gender	Both
Phase	3
Groups that have been masked	- Participant - Investigator
Sample size	Target sample size: 124
Randomization (investigator's opinion)	Randomized
Randomization description	Randomization will be done in a random block method. The size of the blocks is chosen randomly (for example, blocks of 4, 8, and 12) where there is an equal number of each group in each block.
Blinding (investigator's opinion)	Double blinded
Blinding description	The researcher and the participant do not know which drug is the main drug and which is the placebo.
Placebo	Used
Assignment	Parallel
Other design features	So far, the effect of cyproheptadine on appetite and laboratory parameters of chronic kidney patients has not been investigated.
