Investigating the effect of polymethylmethacrylate cement in outcome of proximal humerus fractures

Protocol summary

Study aim

Investigating the effect of PMMA orthopedic cement on improving the jerk interval and daily activities after fixation of proximal humerus type 3 and 4 fractures with metaphyseal defects in patients over 50 years old.

Design

Clinical trial with control group, with parallel groups, single-blind, randomized block, on 60 patients. A software called Sealed Envelope was used for randomization

Settings and conduct

Patients referred to the orthopedic clinic of Vali Asr Arak Hospital with proximal humerus type 3 and 4 fractures with metaphyseal defects will be divided into two groups. In the intervention group, 500 cc of German BONOS bone cement will be used at the site of the metaphyseal defect during surgery. In the control group, cement material will not be used and routine surgery will be performed for the patients. In this study, the surgery will be performed by the supervisor and the orthopedic assistant will be responsible for the follow-up and follow-up of the patients. They do not know how to perform the surgery, so the participants are blinded. The corresponding assistant knows how to group patients and surgical procedures.

Participants/Inclusion and exclusion criteria

Entry criteria: type 3 and 4 proximal humerus fractures with metaphyseal defects; age over 50 years old.

Exclusion criteria: sensitivity to bone cement material; death of the patient.

Intervention groups

Patients with type 3 and 4 proximal humerus fractures with metaphyseal defects will be divided into two groups. In the intervention group, 500 cc of German BONOS bone cement will be used at the site of the metaphyseal defect during surgery. In the control group, cement will not be used and routine surgery will be performed for patients

Main outcome variables

Examination for infection; avascular necrosis; upper limb movements in the form of extension; flexion; external rotation; internal rotation; abduction and adduction.

Scientific title
Investigating the effect of polymethylmethacrylate cement in outcome of proximal humerus fractures

Public title
Investigating the effect of PMMA on the outcome of proximal humerus type 3 and 4 fractures

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
Type 3 and 4 proximal humerus fractures with metaphyseal defects
Age over 50 years
Absence of chronic kidney and liver disease
Absence of cancer
Informed consent to participate in the study
Exclusion criteria:
Allergy to bone cement
Death of the patient
Any cardiorespiratory arrest during surgery

Age
From **50 years** old

Gender
Both

Phase
N/A

Groups that have been masked

- Participant

Sample size
Target sample size: **60**

Randomization (investigator's opinion)
Randomized

Randomization description
The participants will be assigned to two intervention groups according to the order of arrival and based on the randomization sequence that will be produced in advance. This sequence is unpredictable and its arrangement is completely random. Block randomization method with 8 blocks will be used to allocate the samples. In this way, by using the block method random number generation software, the randomization sequence will be produced according to the required sample size for two groups. In the beginning, all the modes that can arrange 2 letters A and B in a block of 8 are produced. Then a block will be selected randomly and by placement among the blocks, and the arrangement pattern in that block will be used to allocate the participants. Then this block will be placed in the main container and another block will be selected again. All these works will be done with a software called Sealed Envelope. Using this method, concealment will also be observed. The concept of concealment is the unpredictability of assigning people to groups. In fact, the researcher will not be able to predict which group the next person will be in.

Blinding (investigator's opinion)
Single blinded

Blinding description
Single-blind - In this study, patients do not know how

they are grouped and how their surgical procedures are performed, so the participants are blinded. The corresponding assistant knows how to group patients and surgical procedures.

Health conditions studied

1

Description of health condition studied

Proximal humerus fractures

ICD-10 code

S42.2

ICD-10 code description

Fracture of upper end of humerus

Primary outcomes

1

Description

Infection

Timepoint

Two weeks after surgery, 1 month after surgery and 3 months after surgery

Method of measurement

Observation

2

Description

Range of motion (ROM)extension; flexion; external

rotation; internal rotation; abduction and adductio

Timepoint

1 and 3 months after surgery

Method of measurement

Disabilities of the Arm, Shoulder and Hand; DASH Questioner

3

Description

Avascular necrosis

Timepoint

1 month after surgery and 3 months after surgery

Method of measurement

DASH questionnaire, graphic observation, examination

4

Description

Screw back out

Timepoint

Two weeks, one month after surgery and three months after surgery

Method of measurement

Graphic observation, examination

5

Description

Screw penetration

Timepoint

Two weeks, one month after surgery and three months after surgery

Method of measurement

Graphic observation, examination

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: Patients with type 3 and 4 proximal humerus fractures with metaphyseal defects, 500 cc of German BONOS bone cement will be used at the site of metaphyseal defects during surgery.

Category

Treatment - Surgery

2

Description

Control group: Patients with type 3 and 4 proximal humerus fractures with metaphyseal defects will not use cement, and routine surgery will be performed for patients.

Category

Treatment - Surgery
