The effect of dynamic tape and kinesio tape on pain and electromyographic activity of selected thigh muscles in women with patellofemoral pain syndrome

Protocol summary

Study aim

This study aims to determine the effect of kinesio tape and dynamic tape on pain and electromyographic activity of selected thigh muscles in 20-30-year-old women with patellofemoral syndrome.

Design

A randomized, single-blind, cross-over, phase 2 study of 40 women with patellofemoral pain. A lottery will be done for randomization.

Settings and conduct

This study will be performed in the sports rehabilitation laboratory of Bu Ali Sina University. Each participant is evaluated in three different sessions with kinesio tape, dynamic tape, and control. The data analyzer will be blinded to the grouping.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Patellofemoral pain syndrome; Pain higher than 3 according to the visual analog scale; Age between 20 and 30 years. Exclusion criteria: showing skin irritation sens to tape; Having a history of lower limb surgery.

Intervention groups

Intervention 1: Kinesiotype. In this condition, kinesio tape is applied to the knee. Then the evaluations are done. Intervention group 2: Dynamic type: In this condition the dynamic tape is applied to the knee. Then the evaluations are done. Control group: In the control condition without tape, evaluations are done.

Main outcome variables

Pain; Electromyographic activity of muscles; Joint position sense; Balance; Postural control

Scientific title

The effect of dynamic tape and kinesio tape on pain and electromyographic activity of selected thigh muscles in

women with patellofemoral pain syndrome

Public title
The effect of dynamic type and kinesio tape on people with patellofemoral pain syndrome

Purpose
Supportive

Inclusion/Exclusion criteria
Inclusion criteria:
A history of pain behind or around the one-sided patella caused by at least two of the following activities: long-term sitting, climbing stairs, squatting, running, kneeling, and jumping positive patellar grind test Pain level of at least 30 mm on a 100 mm visual analog scale
Exclusion criteria:
History of knee surgery Skin irritation to the tape

Age
From **20 years** old to **30 years** old

Gender
Female

Phase
2

Groups that have been masked

- Data analyser

Sample size
Target sample size: **40**

Randomization (investigator's opinion)
Randomized

Randomization description
In this study, 3 interventions of kinesio tape, dynamic tape, and control are investigated and compared in a group of women with patellofemoral pain syndrome. Each intervention is done in a separate session. The order of interventions for each participant will be chosen randomly and by lottery at the beginning of each session.

Blinding (investigator's opinion)
Single blinded

Blinding description
The data analyzer will not be aware of the group's classification. The information of the groups will be provided to the data analyzer in the form of numbers 1, 2, and 3, and for each participant with a code.

Placebo
Not used
