

Clinical Trial Protocol

Iranian Registry of Clinical Trials

16 Sep 2026

Study the effectiveness of curcumin on depression in patients with depression and anxiety

Protocol summary

Study aim

Comparison of the average depression score 8 weeks after receiving (drug plus curcumin) and receiving group (drug plus placebo)

Design

A clinical trial with a control group/double blind/randomized with block method/phase 3/on 100 patients

Settings and conduct

The place of research in this study is a psychiatrist's doctor's office in Tabriz city. A written informed consent form will be obtained and a depression and anxiety questionnaire specific to patients with depression and anxiety will be completed before allocation in groups. Then, the participants will be randomized by block method with the size of blocks of four and six and with an allocation ratio of 1:1. They will be assigned to two intervention groups (curcumin capsule recipients) and control groups (placebo recipients). Allocation sequence will be done by someone not involved in sampling and data collection. Curcumin and placebo capsules will be prepared by Dina Pharmaceutical Company in a completely similar way in terms of appearance

Participants/Inclusion and exclusion criteria

Admission of people suffering from depression and anxiety from the age of 18 to 65 years Exclusion of pregnant and lactating people, people who are allergic to curcumin, people who take other curcumin supplements, and people who have other mental disorders.

Intervention groups

For the intervention group, curcumin capsules with a dose of 500 mg were considered, and for the control group, a placebo for 8 weeks

Main outcome variables

Eight weeks after the start of the intervention, the re-evaluation of depression and anxiety symptoms and quality of life for patients with depression and anxiety will be completed by the participants.
