Comparison of ovarian response to ovulation induction after laparoscopic cystectomy or medical management among infertile women with endometrioma undergoing assisted reproductive technology

Protocol summary

Summary

The purpose of this study is to compare the ovarian response to ovulation induction after laparoscopic cystectomy or medical management among infertile women suffering from endometrioma going through assisted reproductive technology. Our main objective is to define the exact number of oocytes retrieved after these two processes. The sample includes all infertile women aged 40 years or less, with asymptomatic endometrioma undergoing assisted reproductive technology. Diagnosis of endometrioma is based on the evidence found through trans vaginal ultrasound indicating round shaped homogeneous hypoechoe tissue. Infertile couples with maternal cause who undergo TESE (Testicular Sperm Extraction) or PESA (Percutaneous Epididimal Sperm Aspiration) are excluded from the current study. The sample includes 80 patients divided in two groups. First group involves patients with asymptomatic endometrioma receiving IM Dipherelin prior to ovulation induction and the second group are the patients undergoing ovulation induction after laparoscopic ovarian cystectomy followed by IM Dipherelin injection. All patients in both groups receive a single IM dose of Dipherelin monthly for 3 consecutive months before the start of ovulation induction by Gonadotropins. After observing at least two 18 mm follicles in trans vaginal ultrasound, 10 000 units, hCG (10000 units, IM) is injected. The following step is ovarian puncture guided by trans vaginal ultrasound under general anesthesia 36 hours later. Trans cervical embryo transfer is performed 3 days after the puncture. In this study, the following outcomes are compared between two groups: number of retrieved oocytes, dominant follicles, embryos; quality of embryos; the rate of fertilization, chemical and clinical pregnancy.

Scientific title
Comparison of ovarian response to ovulation induction after laparoscopic cystectomy or medical management among infertile women with endometrioma undergoing assisted reproductive technology

Public title
Treatment of endometrioma in infertile women
Purpose
Treatment
Inclusion/Exclusion criteria
Inclusion criteria: Infertile women with endometrioma requiring assisted reproductive technology Exclusion criteria: Age over 40 years; Endometrioma smaller than 2 cm or larger than 6 cm; Male infertility TESE (Testicular Sperm Extraction) or PESA (Percutaneous Epididimal Sperm Aspiration)
Age
From **20 years** old to **40 years** old
Gender
Female

Phase
N/A
Groups that have been masked
No information
Sample size
Target sample size: **80**
Randomization (investigator's opinion)
Randomized
Randomization description
Blinding (investigator's opinion)
Not blinded
Blinding description
Placebo
Not used
Assignment
Parallel
Other design features
All volenteers with inclusion criteria are asked to participate in the current study if agreed, a informed consent form is signed. she is randomly assigned to one of two groups based in Bertoli distribution. If she has an objection, we will switch her to another group.

Primary outcomes

1

Description
The number of retrieved oocytes
Timepoint
84 days after the first Dipherelin injection
Method of measurement
Invert Microscope, Diaphot 300, Nikon, Japan

Secondary outcomes

1

Description
The number of dominant follicles
Timepoint
82 days after the first Dipherelin injection
Method of measurement
nGS= number of observed gestatinal sac in trans vaginal sonography, nET= number of embryonal transfer, clinical pregnancy rate(%)= nGS/ nET x100

2

Description
fertilization rate
Timepoint
87 days after the first Dipherelin injection
Method of measurement
nE= number of total embryos, nI= number of injected oocytes, fertilization rate(%)= nE/ nI x 100

3

Description
The number and quality of embryos
Timepoint
87 days after the first Dipherelin injection
Method of measurement
Invert Microscope, Diaphot 300, Nikon, Japan

4

Description
chemical pregnancy
Timepoint
101 days after the first Dipherelin injection
Method of measurement
βhCG test

5

Description
clinical pregnancy rate
Timepoint
115 days after the first Dipherelin injection
Method of measurement
nGS= number of observed gestatinal sac in trans vaginal sonography, nET= number of embryonal transfer, clinical pregnancy rate(%)= nGS/ nET x100

Intervention groups

1

Description
First group receives 3 consecutive single IM doses of Dipherelin 3.75mg (Beaufouipfen, France) in 3 consecutive months.Ten days after the third IM dose of Dipherelin ovarian stimulation is conducted by using Gonal F (Serono, Switzerland, 300-450IU daily), for one week. Then Gonal F is replaced by HMG (Ferring, Germany, 300-450IU daily) until the observation of 18mm follicles in trans vaginal ultrasound. For visualizing follicular development, trans vaginal ultrasound (Sonoline G20; Siemens Medical Solutions, California, USA) is performed every 4 days. After the observation of at least two 18mm follicles, HCG (Ferring Co, Germany, 10000IU, IM) is injected and after 36 hours oocyte retrieve is performed under general anesthesia. Three days after fertilization technique performed through intra cytoplasmic sperm injection (ICSI), trans cervical embryo transfer will be carried out. Detection of pregnancy is through serum BhCG analysis, 3 days after embryonic transfer and the clinical pregnancy is detected by the aid of trans vaginal ultrasound, two weeks later when the pregnancy sac is detected. Main outcome is the number of oocytes retrieved. The number of oocytes retrieved, dominant follicles, embryos; quality of embryos;the rate of fertilization, laboratory and clinical pregnancy are compared between two groups.
