Comparing the efficacy of photodynamic laser 660 by methylene blue with photodynamic laser 810 by indocyanine green on denture stomatitis

Protocol summary

Study aim
Comparing the efficacy of photodynamic laser 660 by methylene blue with photodynamic laser 810 by indocyanine green on denture stomatitis

Design
This is a randomized, double-blinded clinical trial with a parallel design. Phase 2-3 this randomized study will be conducted on 40 patients with dentures. A blocking random method is used for randomization and the participants are assigned to two intervention groups.

Settings and conduct
This study, which will be conducted in the Faculty of Dentistry of Isfahan Azad University, is a double-blinded one. The researcher and the participants have no role in allocating intervention and control groups. The same researcher evaluates the presence or absence of denture stomatitis based on clinical symptoms and direct observations of the palate mucosa, which is classified into three types according to Newton's suggestion.

Participants/Inclusion and exclusion criteria
Inclusion criteria: Informed consent; Patients with dentures and confirmed clinical evidence of denture stomatitis Exclusion criteria: Patients with a history of diabetes, immunosuppression, radiotherapy, and chemotherapy; Patients who have received antibiotics, antifungal drugs, or steroids in the last 3 months

Intervention groups
In the first intervention group, photodynamics will be sprayed by means of methylene blue with laser 660 twice a week for two weeks, on both the surface of the prosthesis and the palatal mucosa with light-sensitive methylene blue with a concentration of 450 µg/ml for 10 minutes before the irradiation. In the second intervention group, photodynamics by green indocyanine with laser 810, twice a week for two weeks with a concentration of 1 mg/ml in sterile distilled water will be prepared and kept at room temperature until use..

Main outcome variables
The extent of red, burning areas

Scientific title
Comparing the efficacy of photodynamic laser 660 by methylene blue with photodynamic laser 810 by indocyanine green on denture stomatitis

Public title
Comparing the efficacy of photodynamic laser 660 by methylene blue with photodynamic laser 810 by indocyanine green on denture stomatitis

Purpose
Treatment

Inclusion/Exclusion criteria

Inclusion criteria:
Informed consent Patients with dentures and confirmed clinical evidence of denture stomatitis

Exclusion criteria:
Patients with a history of diabetes, immunosuppression, radiotherapy, and chemotherapy Patients who have received antibiotics, antifungal drugs or steroids in the last 3 months

Age
No age limit

Gender
Both

Phase
2-3

Groups that have been masked
No information

Sample size
Target sample size: **40**

Randomization (investigator's opinion)
Randomized

Randomization description
Randomization using the blocking method with blocks in sizes 6 and 9. For randomization, the site https://www.sealedenvelope.com is used. All codes are recorded on paper and stored in specific envelopes. Each of the generated codes is kept separately inside the envelope and the secretary gives one of these envelopes to the patient before the patient enters the doctor's room. Accordingly, the next patient code is not predictable. The doctor determines which treatments to perform based on the patient's code. Only the physician performing the intervention will be aware of the code assigned to the patient. After evaluating the outcome, based on the patient's name, the collected information will be linked to the assigned code

Blinding (investigator's opinion)
Double blinded

Blinding description
Medications can only be identified by the serial number on the container. The serials are with the main doctor and will remain confidential until the end of the study. The charge of injecting medications will not know about the assignment of individuals to groups. The participants will not know about the allocation of study groups. Therefore, this study will be a double-blinded one

Placebo

Treatment - Drugs

2

Description
In the second intervention group, photodynamics with laser 810 twice a week by green indocyanine will be prepared for two weeks with a concentration of 1 mg/ml in sterile distilled water and kept at room temperature until use. It should be applied on both the prosthesis and the palate mucosa surfaces with a sterile water swab. After 10 minutes, laser irradiation is performed by an experienced operator using an 810 nm diode laser.
