Iranian Registry of Clinical Trials

01 Jul 2026

Investigating the effect of nutritional education based on the precede-Proceed model and according to the food basket introduced by the Ministry of Health on improving the growth indicators and food intake of malnourished children aged 7-12 years

Protocol summary

Study aim

Determining the effect of nutritional education based on the PRECEDE-PROCEED model and according to the optimal food basket introduced by the Ministry of Health on improving the growth indicators and food intake of 7-12 year old children suffering from malnutrition in Kermanshah.

Design

The current study is a randomized controlled trial (clinical trial). Malnourished children aged 7 to 12 who meet the inclusion criteria are included in the study. After obtaining informed consent, 254 people were selected from among them and randomly divided into two intervention and control groups of 127 people.

Settings and conduct

This study will be conducted in primary schools of Kermanshah and on malnourished children. Malnourished children are identified using anthropometric indicators and growth monitoring charts, and they are enrolled and enrolled in the study considering the entry and exit criteria.

Participants/Inclusion and exclusion criteria

Inclusion criteria: willingness to cooperate, suffering from mild, moderate and severe malnutrition (diagnosed using anthropometric assessments and growth percentiles), children's age in the range of 7 to 12 years, not using vitamin and mineral supplements, not having underlying, genetic diseases, acute gastrointestinal, respiratory infections, acute-chronic renal failure, active liver disease, red blood cell hemolysis, intestinal parasites, hyperactivity and attention deficit. Exclusion criteria: unwillingness to continue cooperation, hospitalization and accidents.

Intervention groups

127 malnourished children who are under nutrition education according to the PRECEDE- PROCEED model

and according to the optimal food basket introduced by the Ministry of Health.

Main outcome variables

Average scores of predisposing factors, enhancing factors, enabling factors Average growth indices (height for age, weight for age, BMI for age)

Randomization (investigator's opinion)

Randomized

Randomization description

The participants of this study from public and non-profit primary schools in Kermanshah city were identified by student using anthropometric indicators and growth monitoring charts, and taking into account the entry and exit criteria, they were registered and enrolled. Then, using block randomization method, they are divided into intervention and control groups. The size of the blocks is not equal and is chosen randomly, which can include 10 blocks of 20, 5 blocks of 10 and 2 blocks of 2, and there are equal numbers of each group A and B in each block. A): intervention group and B: control group) Random numbers are generated by the statistical consultant and the random allocation of people to two groups of intervention and control will be done by the project manager (supervisor) and the student is not aware of

this allocation. Coded boxes will also be used to hide random sequences.
