

Clinical Trial Protocol

Iranian Registry of Clinical Trials

18 Sep 2026

Investigating the effect of acute normovolemic blood dilution on the function of vital organs in patients who are candidates for heart surgery

Protocol summary

Study aim

Determining the effect of acute normovolemic blood dilution on the function of vital organs in patients who are candidates for heart surgery

Design

A controlled, parallel-group, triple-blinded, randomized clinical trial on 60 patients. Randomized Block Design method was used for randomization.

Settings and conduct

In the intervention group, one unit of blood is taken from adult patients who are candidates for heart surgery with hemoglobin greater than or equal to 14 after general anesthesia. In the control group, there are patients who are candidates for heart surgery with hemoglobin greater than or equal to 14, and we only perform routine heart surgery interventions. The place of study will be Chamran Hospital, Isfahan. Patients, researchers and analysts are not aware of the patient group.

Participants/Inclusion and exclusion criteria

The participants of the study are adult patients who are candidates for heart surgery with hemoglobin greater than or equal to 14.

Intervention groups

In the intervention group, one unit of blood is taken from adult patients who are candidates for heart surgery with hemoglobin greater than or equal to 14 after general anesthesia. Blood sampling is done through an arterial catheter that is implanted for the purpose of invasive blood pressure measurement. In the control group, there are patients who are candidates for heart surgery with hemoglobin greater than or equal to 14, and we only perform routine heart surgery interventions.

Main outcome variables

Renal function and respiratory function of the patient 48 hours after the operation

Scientific title

Investigating the effect of acute normovolemic blood dilution on the function of vital organs in patients who are candidates for heart surgery

Public title

Investigating the effect of acute normovolemic blood dilution on the function of vital organs in patients who are candidates for heart surgery

Purpose

Supportive

Inclusion/Exclusion criteria**Inclusion criteria:**

Adult patients candidates for heart surgery Ejection fraction more than 40% Hemoglobin greater than and equal to 14 No kidney, liver, respiratory or brain failure

Exclusion criteria:

Pump time more than 120 minutes Use of circulatory arrest Reoperation due to surgical bleeding

Age

No age limit

Gender

Both

Phase

N/A

Groups that have been masked

- Participant
- Investigator
- Data analyser

Sample size

Target sample size: 60

Randomization (investigator's opinion)

Randomized

Randomization description

This stage will be by randomized block design method. At this stage, patients will be divided into 2 blocks (30 blocks of 2). Then they are sorted according to the national code (the larger national code of the first row of the block and the smaller national code of the second row of the block). After that, we refer to the table of random numbers for each block. If the selected number was from 0 to 4, the patient in the first row will join group A and the patient in the second row will join group B. If the selected number is from 5 to 9, the patient in the first row will join group B and the patient in the second row will join group A. After 30 patients of group A and 30 patients of group B were determined, group A will be the intervention group and group B will be the control group.

Blinding (investigator's opinion)

Triple blinded

Blinding description

The patient, all study investigators and data analyzers were blinded to patient grouping. The patient is unconscious during the intervention, and the study researchers (data collectors) and data analyzers are unaware of the intervention.
