The Effect of Individual Sexual Counselling on Psychosocial Status of Post MI Patients- Single-Blinded Randomised Clinical Trial

Protocol summary

Summary

This study is designed to determine the individual sexual consultation effect on psycho social condition of post MI patients. This study is a single blinded RCT research that samples will be random allocated to control and intervention groups. Inclusion criteria are to be married, suffering MI and to have sexual activity before MI. Exclusion criteria are erection disorder and urinary tract disease. Sample size is determined according to similar studies which is 25 patients per group. Intervention in this study is individual consultation for intervention group for 20 minutes in four days after admission in hospital. Output of this study will be psycho social condition (anxiety, depression, quality of life and sexual satisfaction) of the MI patients.
